# Develop RESTFul API

# Topics

# Basic of REST

REST (REpresentational State Transfer)

6 REST constraints

REST vs RESTful API

Design principles

# Spring Boot

Goals of Spring Boot

Create project

Better project structure of Spring Boot

Develop RESTful APIs

Layer in Spring Boot project

Error handling

Manage database with Spring Data

Testing

Observable service

# NodeJS

Basic of NodeJS

Create project with npm

Project structure of project

Develop RESTful APIs

Error handling

Manage database (postgresql and redis)

Testing

Observable service

# Go

Basic of go

Create project with go module

Project structure of project

Develop RESTful APIs

Error handling

Manage database (postgresql and redis)

Testing

Observable service

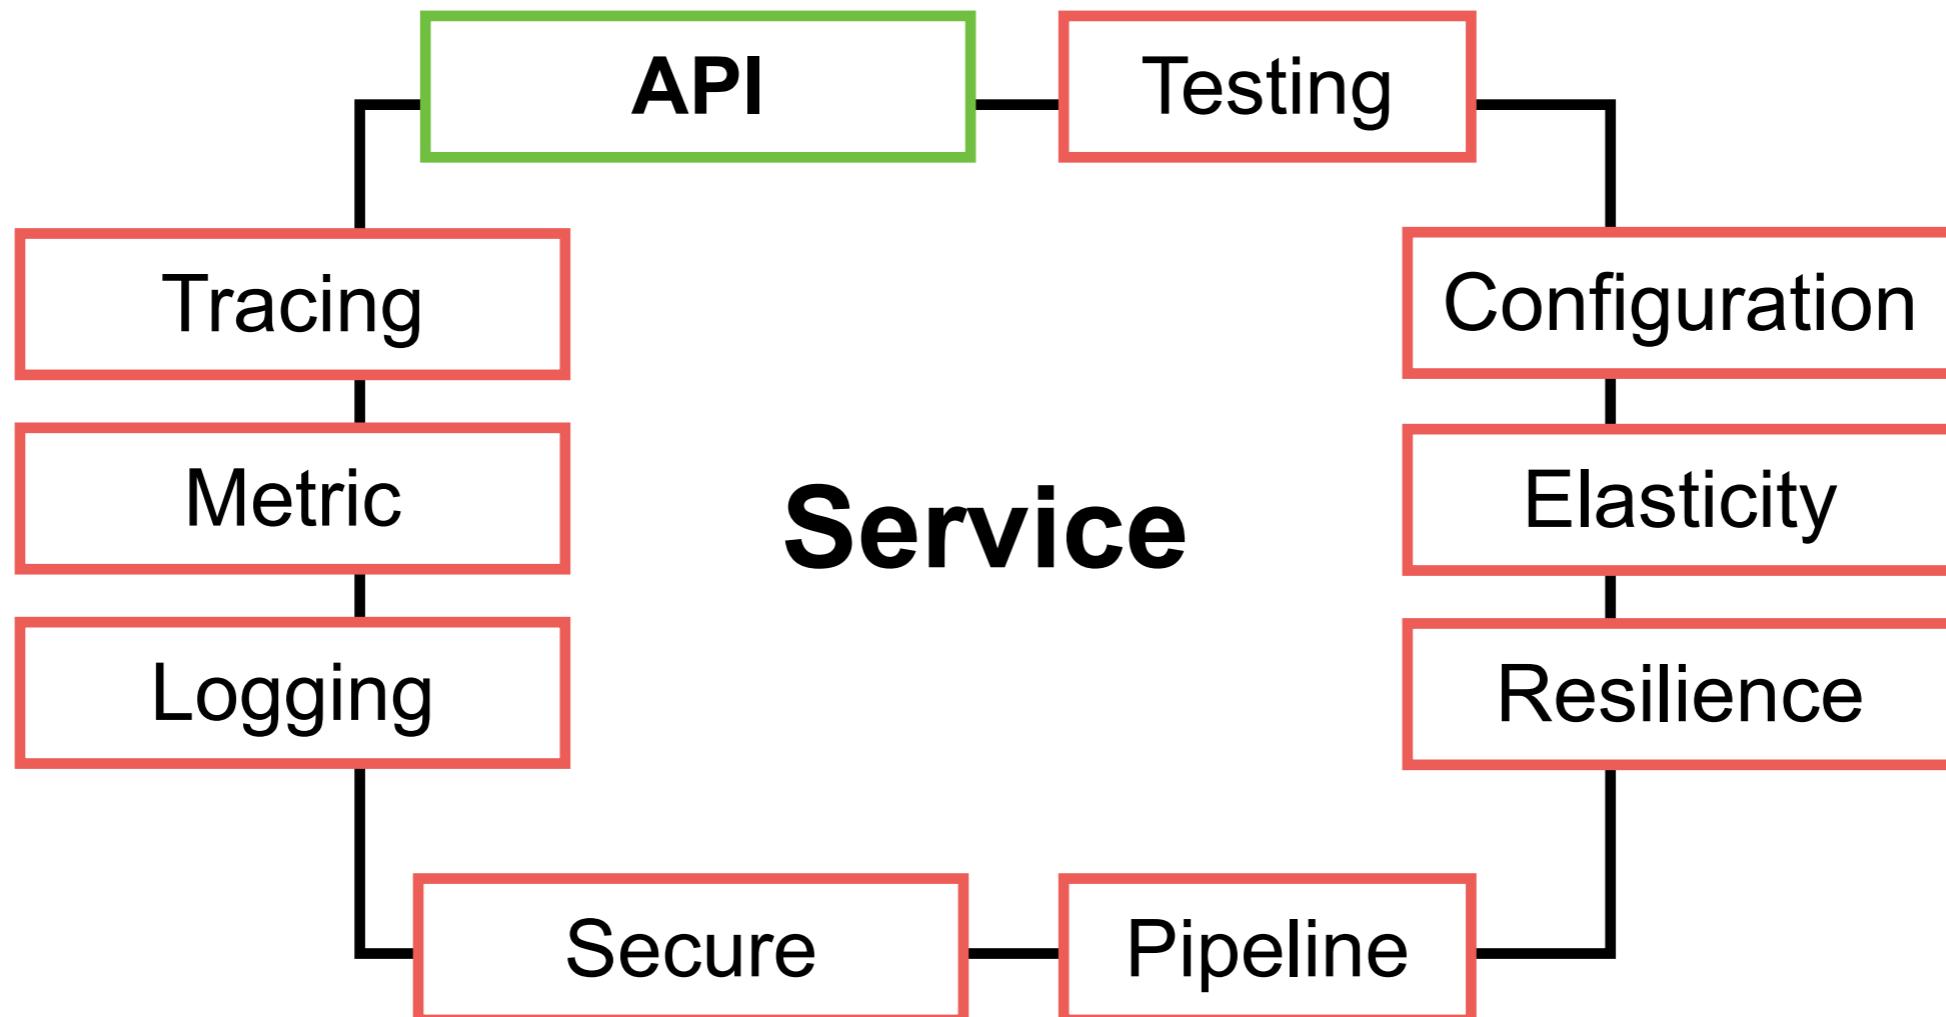

# My Rule

**Always write tests**

# Properties of Service

# APIs

## Application Programming Interface

**REST API**

**gRPC**

**Messaging**

# REST API

# **REST**

## **REpresentation State Transfer**

**The style of software architecture behind RESTful services**

**Defined in 2000 by Roy Fielding**

[https://www.ics.uci.edu/~fielding/pubs/dissertation/rest\\_arch\\_style.htm](https://www.ics.uci.edu/~fielding/pubs/dissertation/rest_arch_style.htm)

# Goals

Scalability  
Generality of interfaces  
Independent deployment of components

# REST properties

Performance

Scalability

Simplicity

Modification

Visibility

Portability

Reliability

# REST constraints

Client-server

Stateless

Cacheable

Layer system

Uniform  
interface

Code on  
demand

eg. JavaScript

# **RESTful service**

Implementation from REST

# REST Request Messages

RESTful request is typically in form of  
**Uniform Resource Identifiers (URI)**

# REST Request Messages

RESTful request is typically in form of  
**Uniform Resource Identifiers (URI)**

Structure of URI depend on specific service

# REST Request Messages

RESTful request is typically in form of  
**Uniform Resource Identifiers (URI)**

Structure of URI depend on specific service

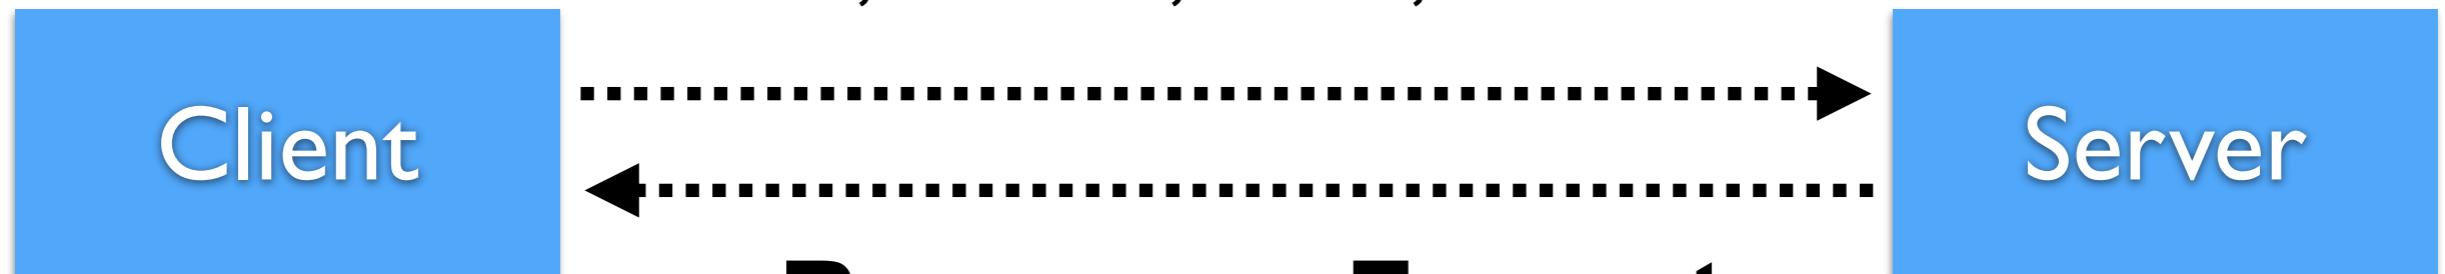

Request can include parameter and data in  
body of request as XML, JSON etc.

# REST Request & Response

**Request Method**

GET, POST, PUT, DELETE

**Response Format**

XML or JSON

# Status Code

Code	Description
1xx	Information
2xx	Successful
3xx	Redirection
4xx	Client error
5xx	Server error

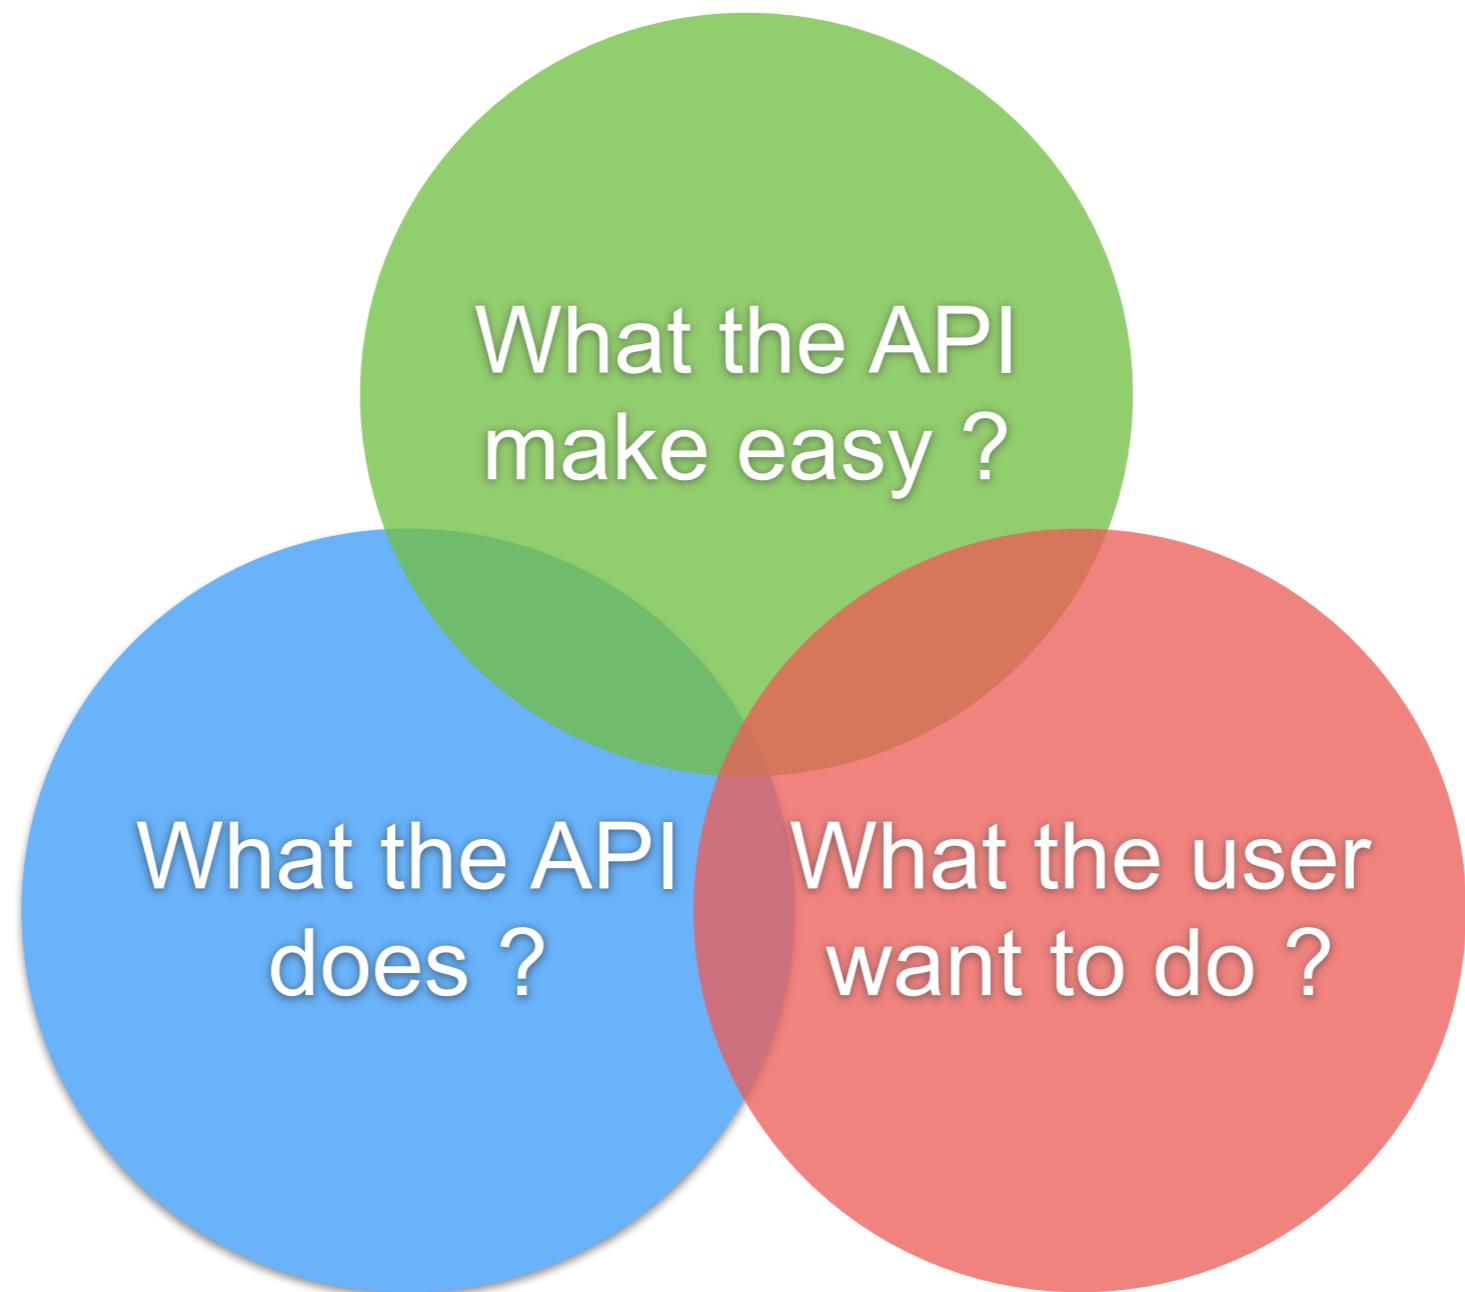

<https://developer.mozilla.org/en-US/docs/Web/HTTP/Status>

# Response format ?

# Good APIs ?

# Principles of API Design

# Principles of API Design

Consistency

Statelessness

Resource-oriented design

Use standard  
HTTP methods

Versioning

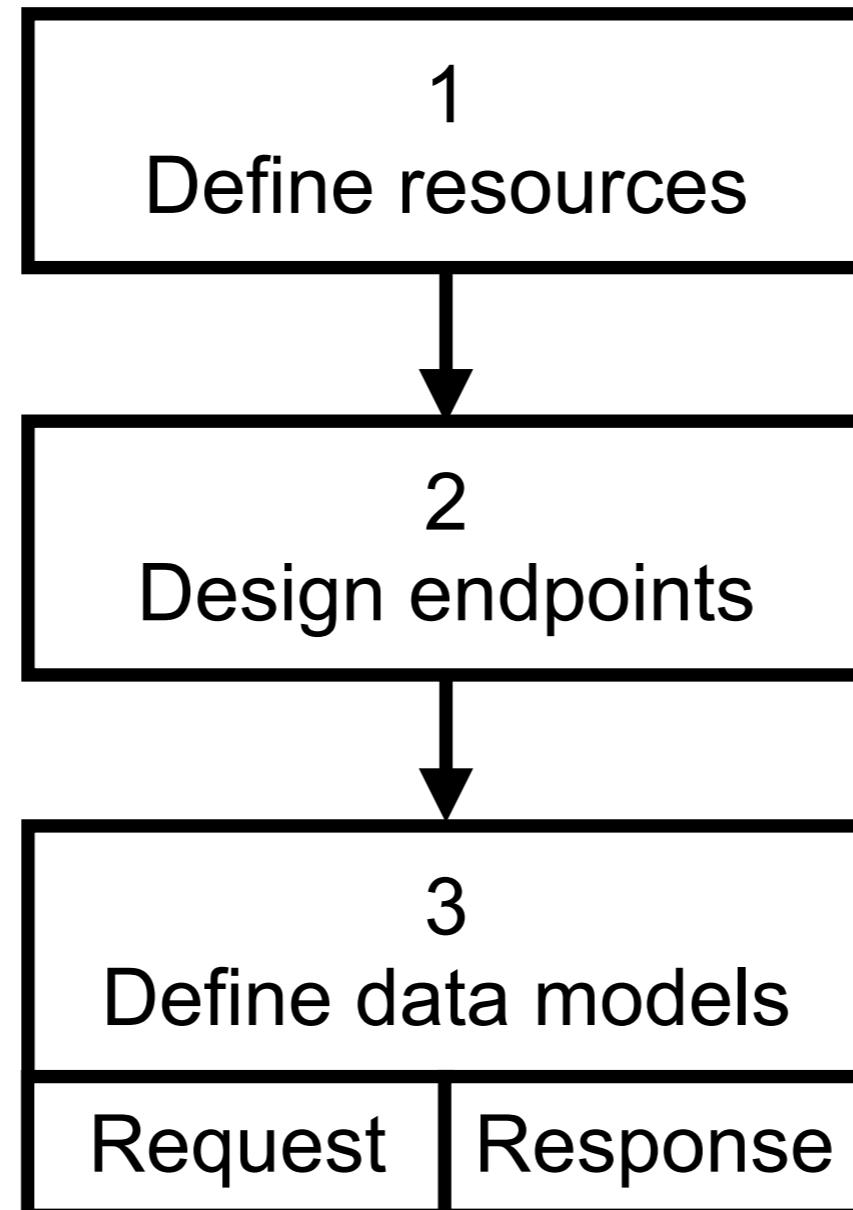

# HTTP Methods meaning

Method	Meaning
GET	Read data
POST	Create/Insert new data
PUT/PATCH	Update data or insert if a new id
DELETE	Delete data

# Steps to Design APIs

filtering

Error handling

Documentation

Testing

Monitoring and  
Observability

# Implementation

Coding

Testing

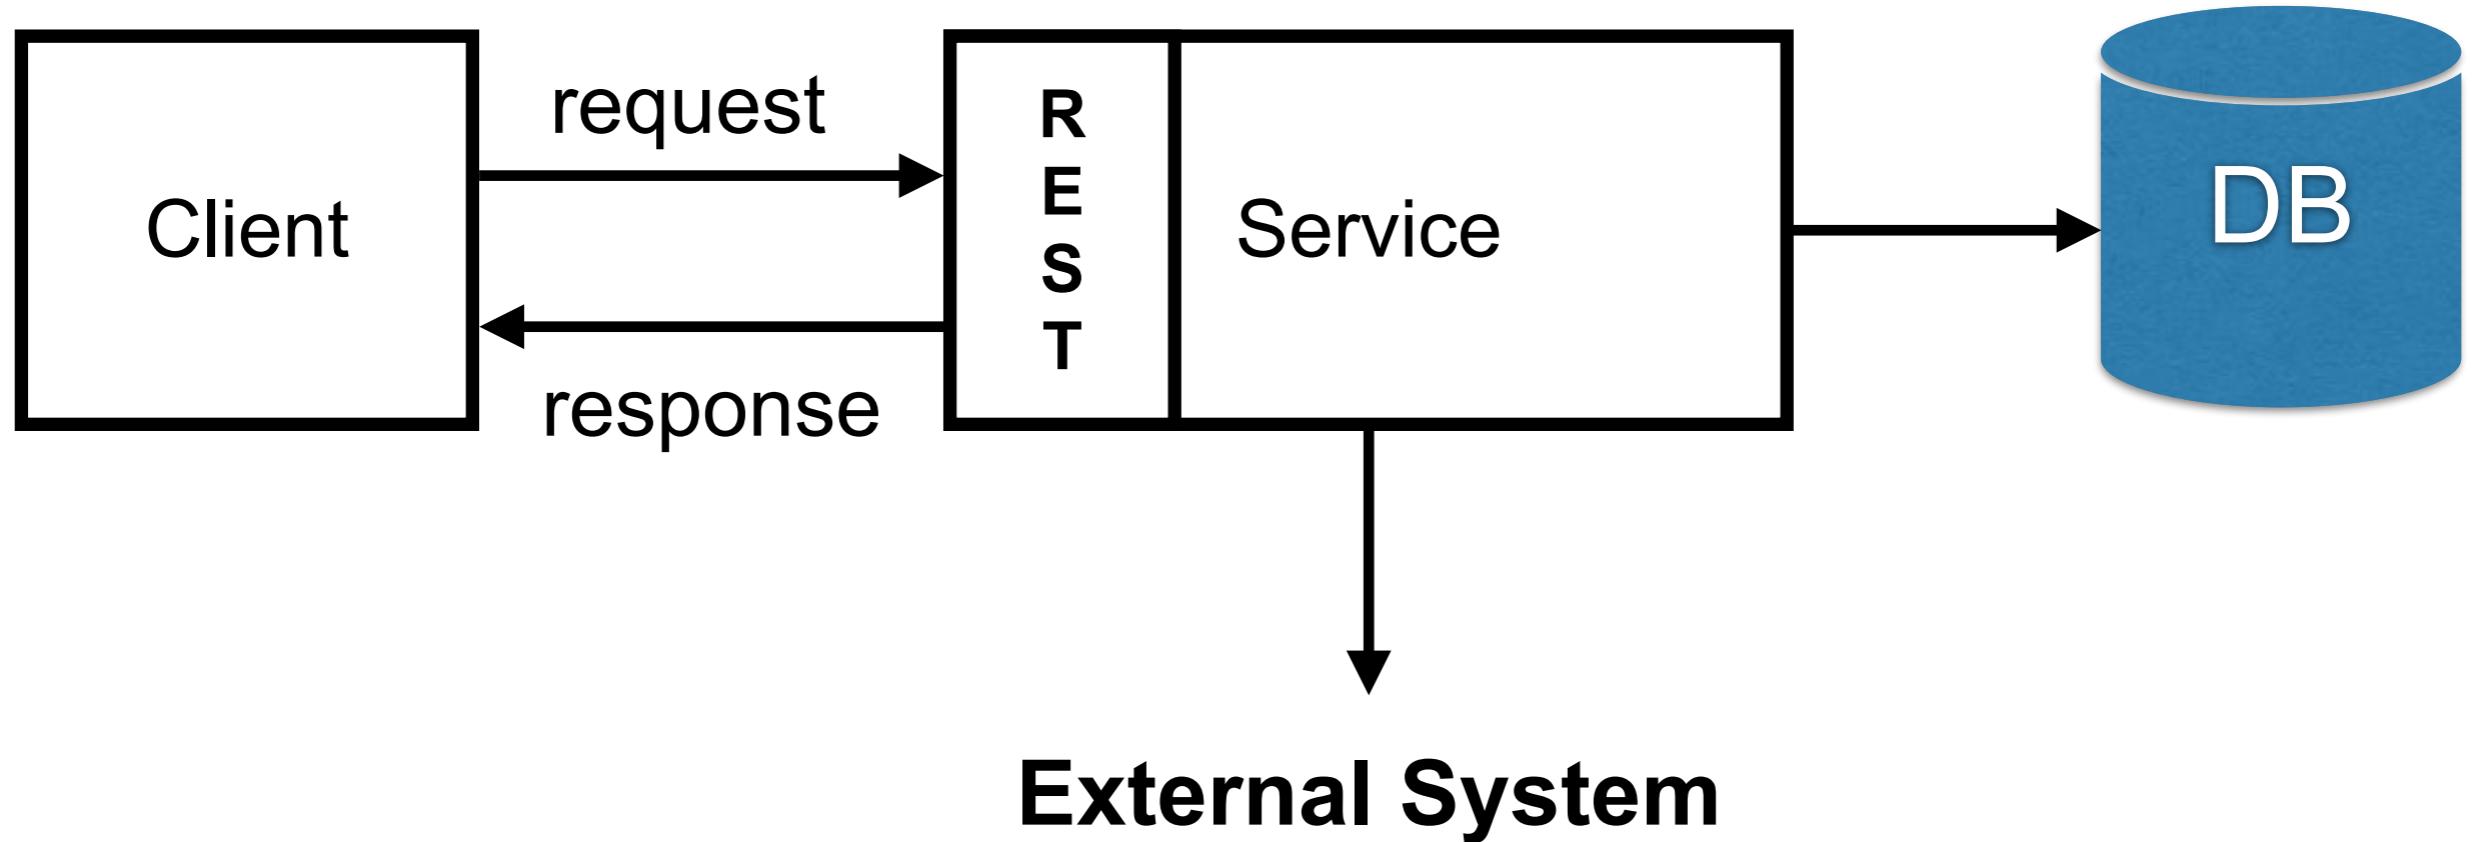

Observability

Performance

Security

# Structure of Service

# Design RESTful APIs

# Users

Method	Path	Description
GET	/users	Get all users
GET	/users/{id}	Get user by id
POST	/users	Create new user
PUT	/users/{id}	Update user
DELETE	/users/{id}	Delete user by id

# HTTP status codes

Code	Description	Example
1xx	Informational responses	100 = Continue 101 Switching protocols
2xx	Success	200 = OK 201 = Created
3xx	Redirection	300 = Multiple choices 301 = Moved permanently
4xx	Client errors	400 = Bad request 403 = Forbidden 404 = Not found
5xx	Server errors	500 = Internal server error 502 = Bad gateway 503 = Service unavailable

# API Documentation

## pet Everything about your Pets

**POST** /pet/{petId}/uploadImage uploads an image 

**POST** /pet Add a new pet to the store 

**PUT** /pet Update an existing pet 

**GET** /pet/findByStatus Finds Pets by status 

**GET** /pet/{petId} Find pet by ID 

**POST** /pet/{petId} Updates a pet in the store with form data 

**DELETE** /pet/{petId} Deletes a pet

# Create Spring Boot project

The screenshot shows the Spring Initializr web application interface. It has several sections:

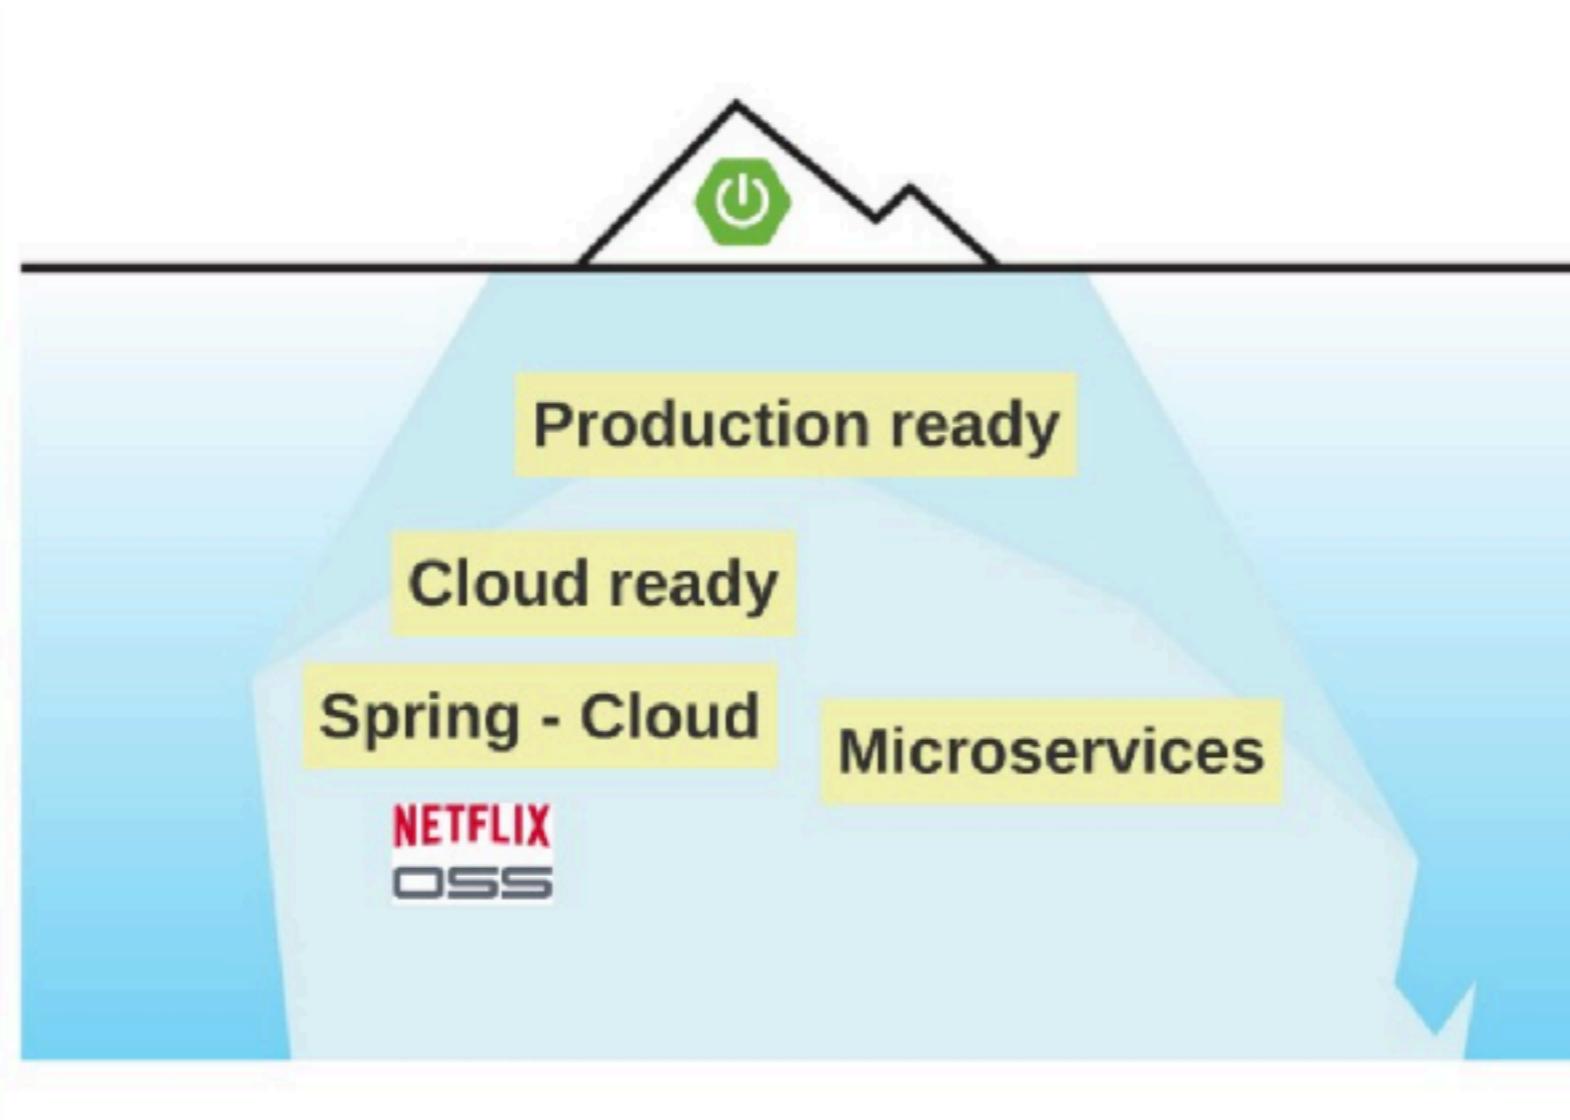

- Project**: Options for Gradle - Groovy, Gradle - Kotlin, Maven, Java, and Groovy.
- Language**: Options for Java (selected), Kotlin, and Groovy.
- Dependencies**: A button labeled "ADD DEPENDENCIES..." with a keyboard shortcut "⌘ + B". Below it, it says "No dependency selected".
- Spring Boot**: Options for 3.5.0 (SNAPSHOT), 3.5.0 (M3), 3.4.5 (SNAPSHOT), 3.4.4 (selected), 3.3.11 (SNAPSHOT), and 3.3.10.
- Project Metadata**: Fields for Group (com.example), Artifact (demo), Name (demo), Description (Demo project for Spring Boot), and Package name (com.example.demo).
- Buttons at the bottom**: "GENERATE ⌘ + ↵", "EXPLORE CTRL + SPACE", and "...".

<https://start.spring.io/>

# Why Spring Boot ?

Application skeleton generator  
Reduce effort to add new technologies

# What ?

Embedded application server

Integration with tools/technologies (starter)

Production tools (monitoring, health check)

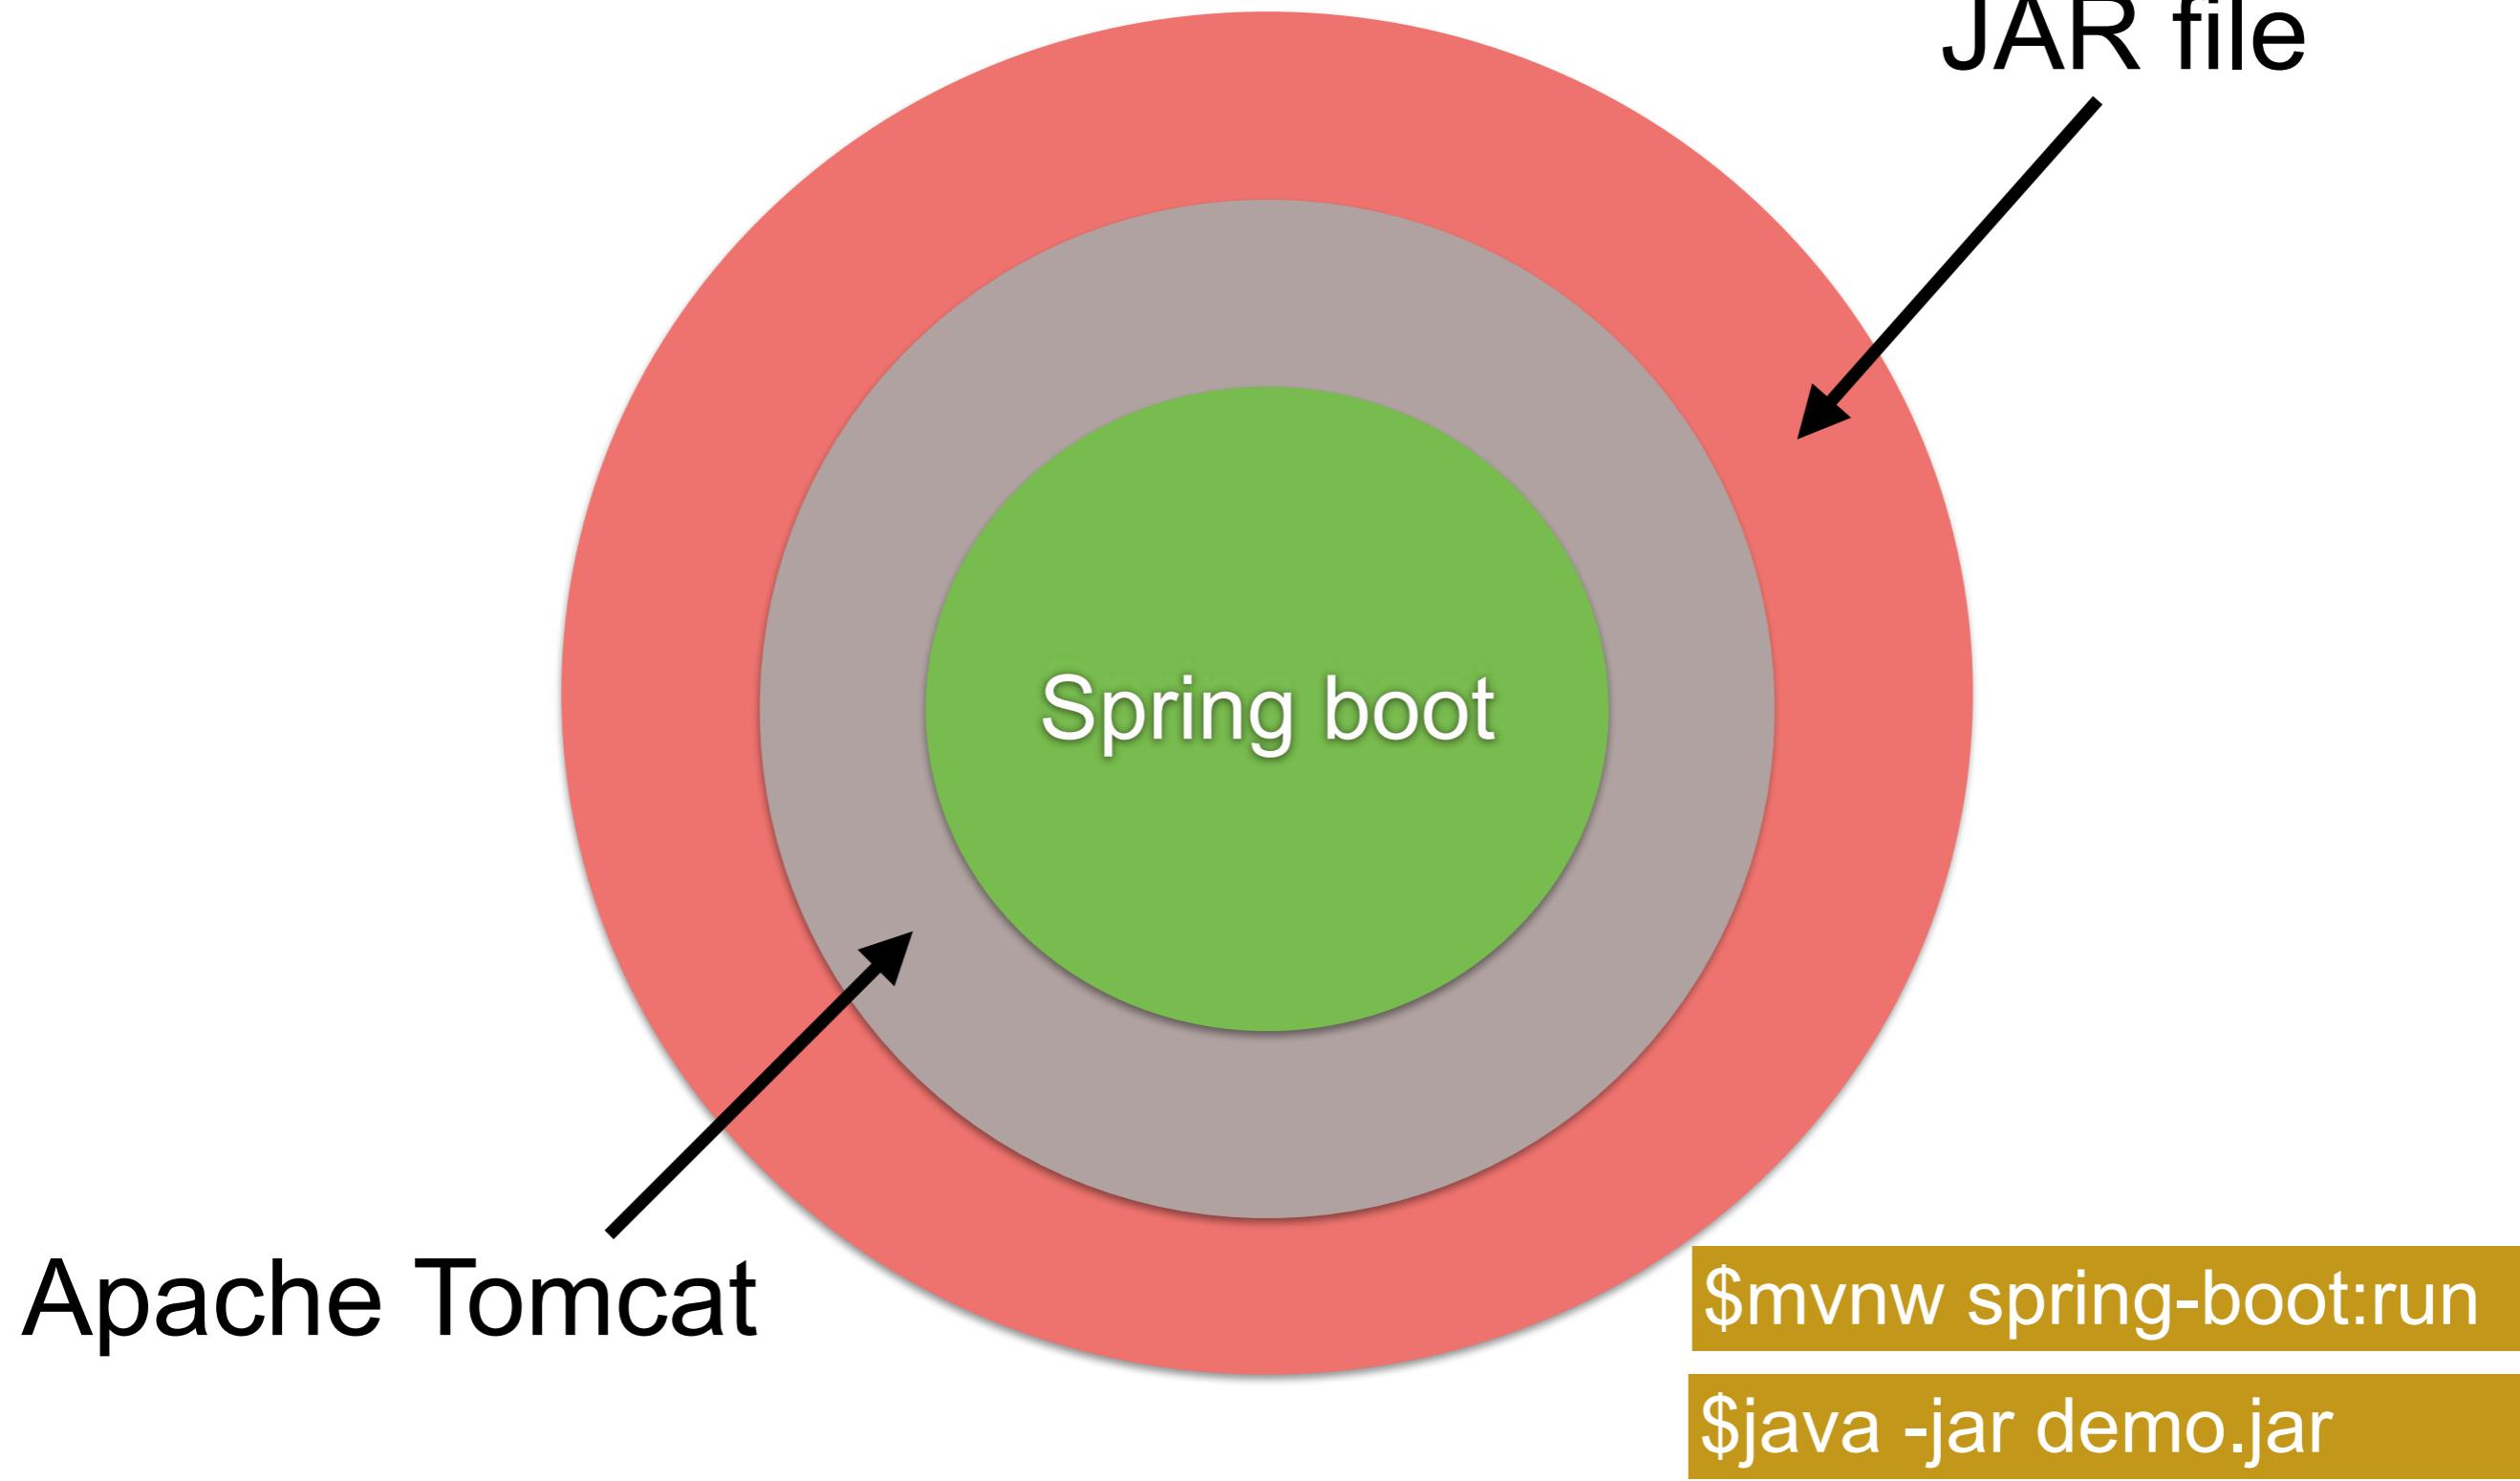

Configuration management

Dev tools

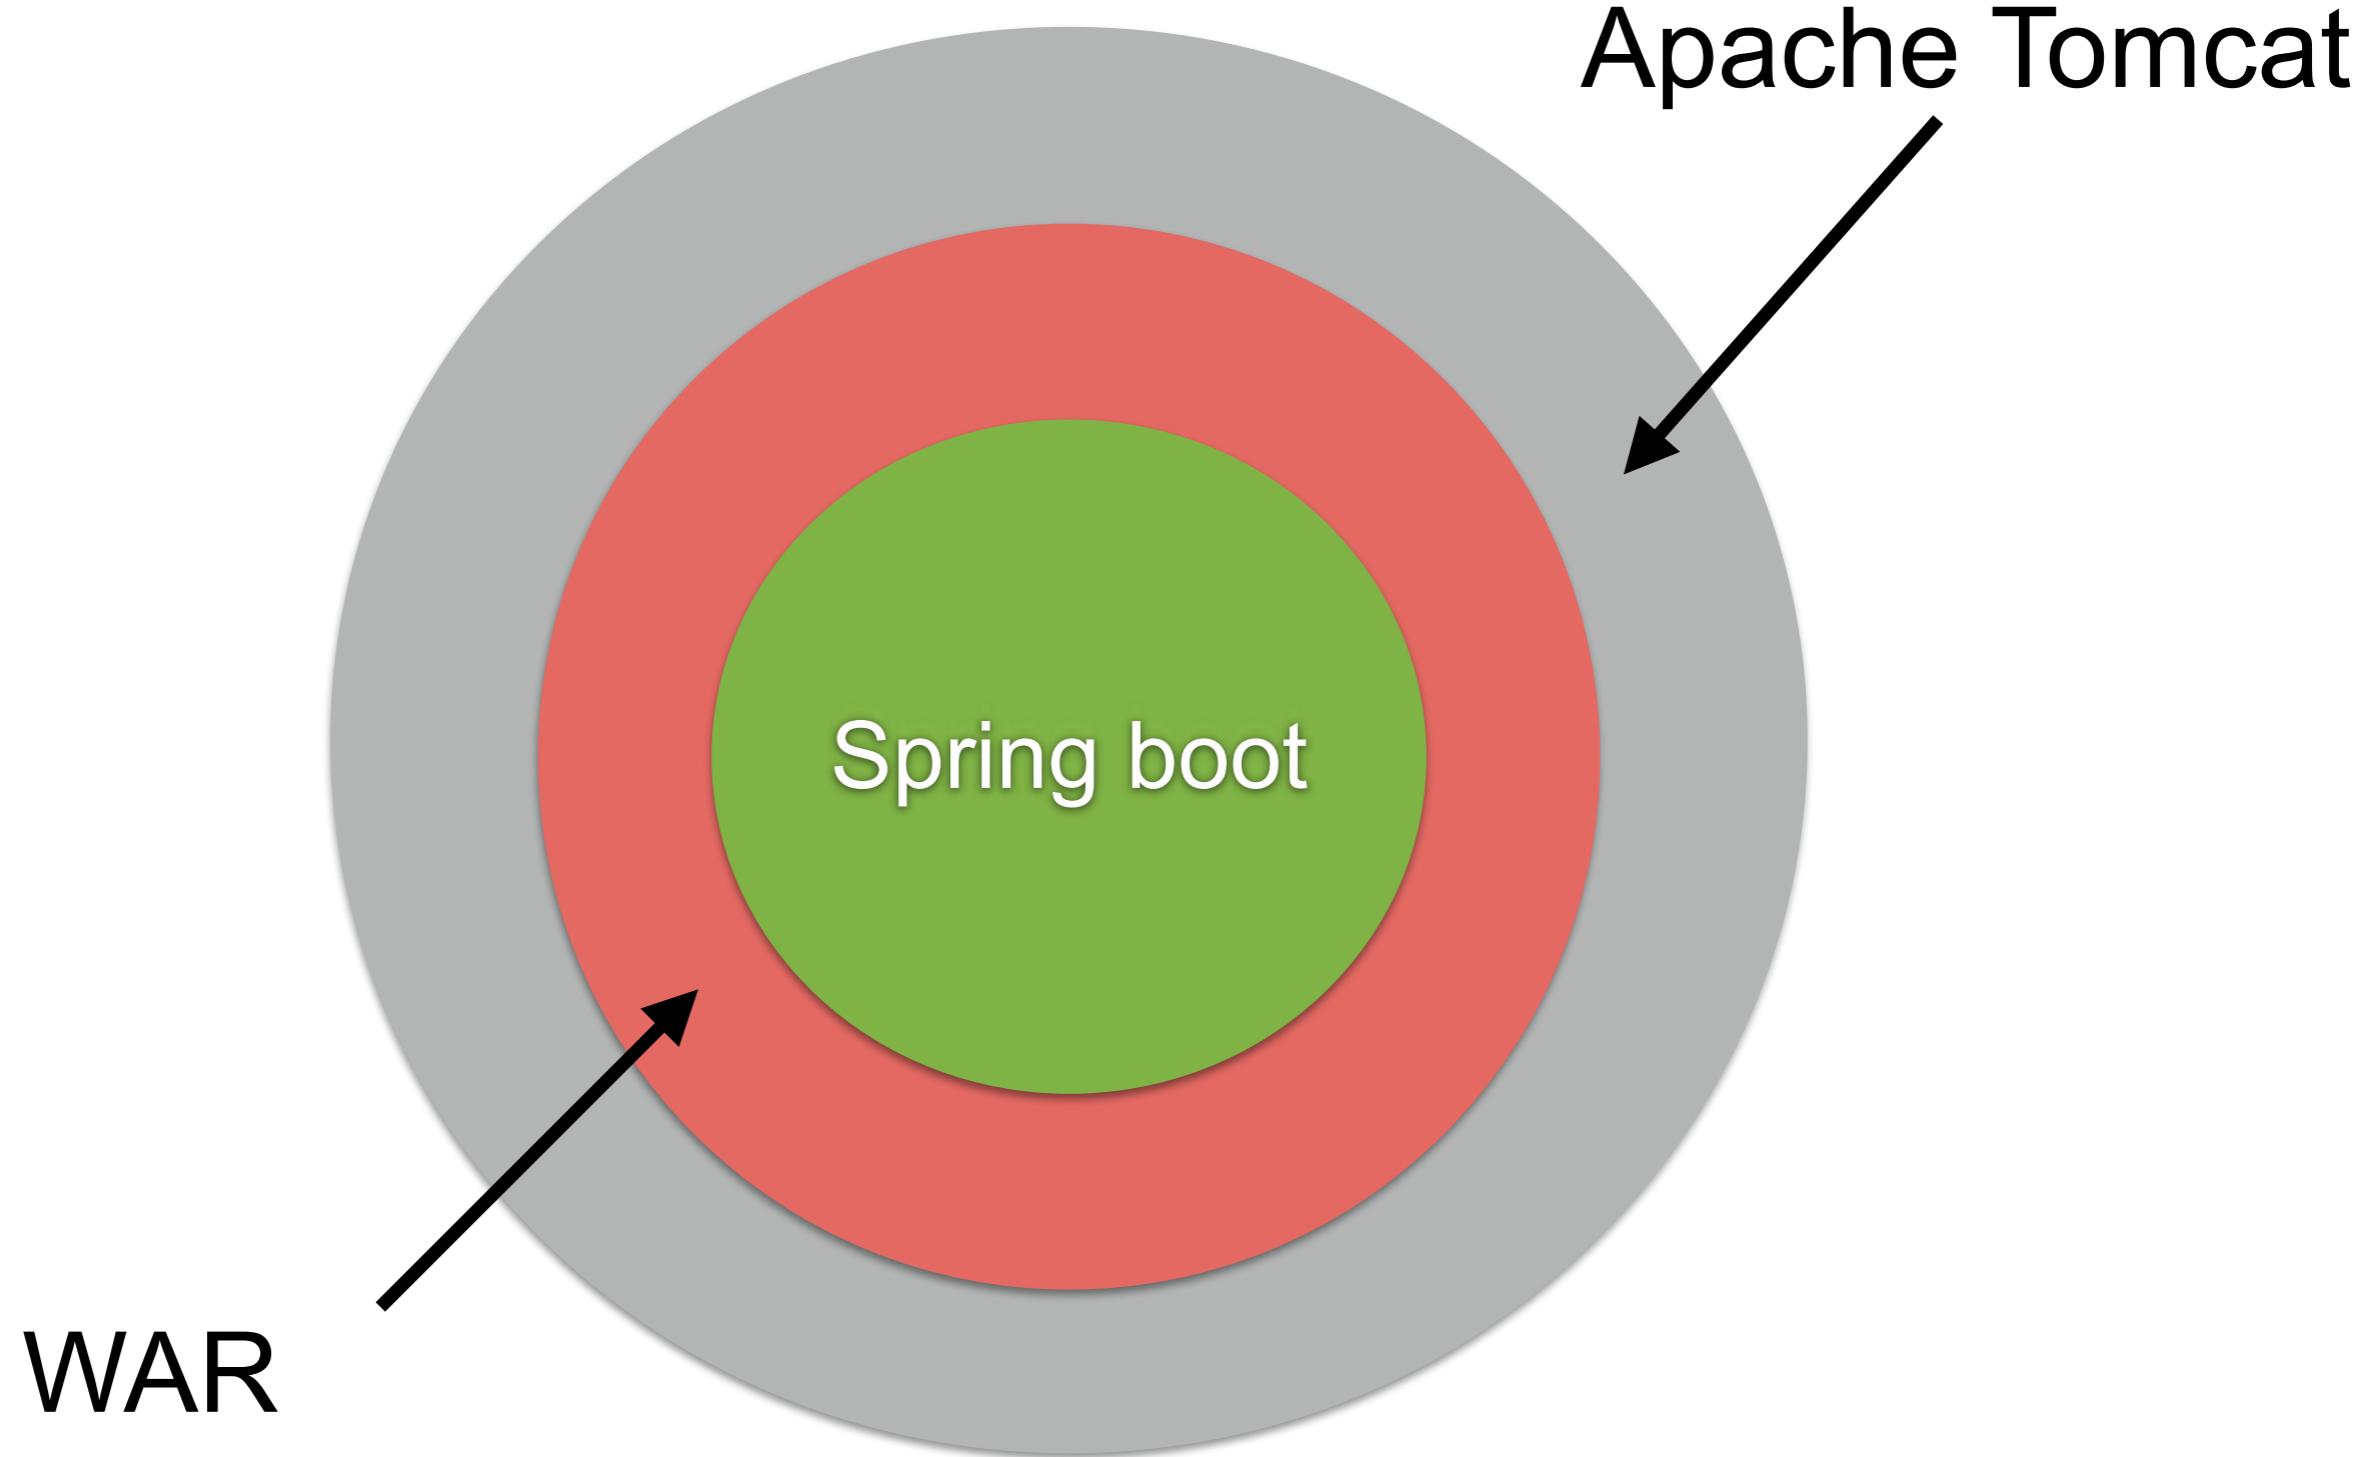

No source code generation, no XML

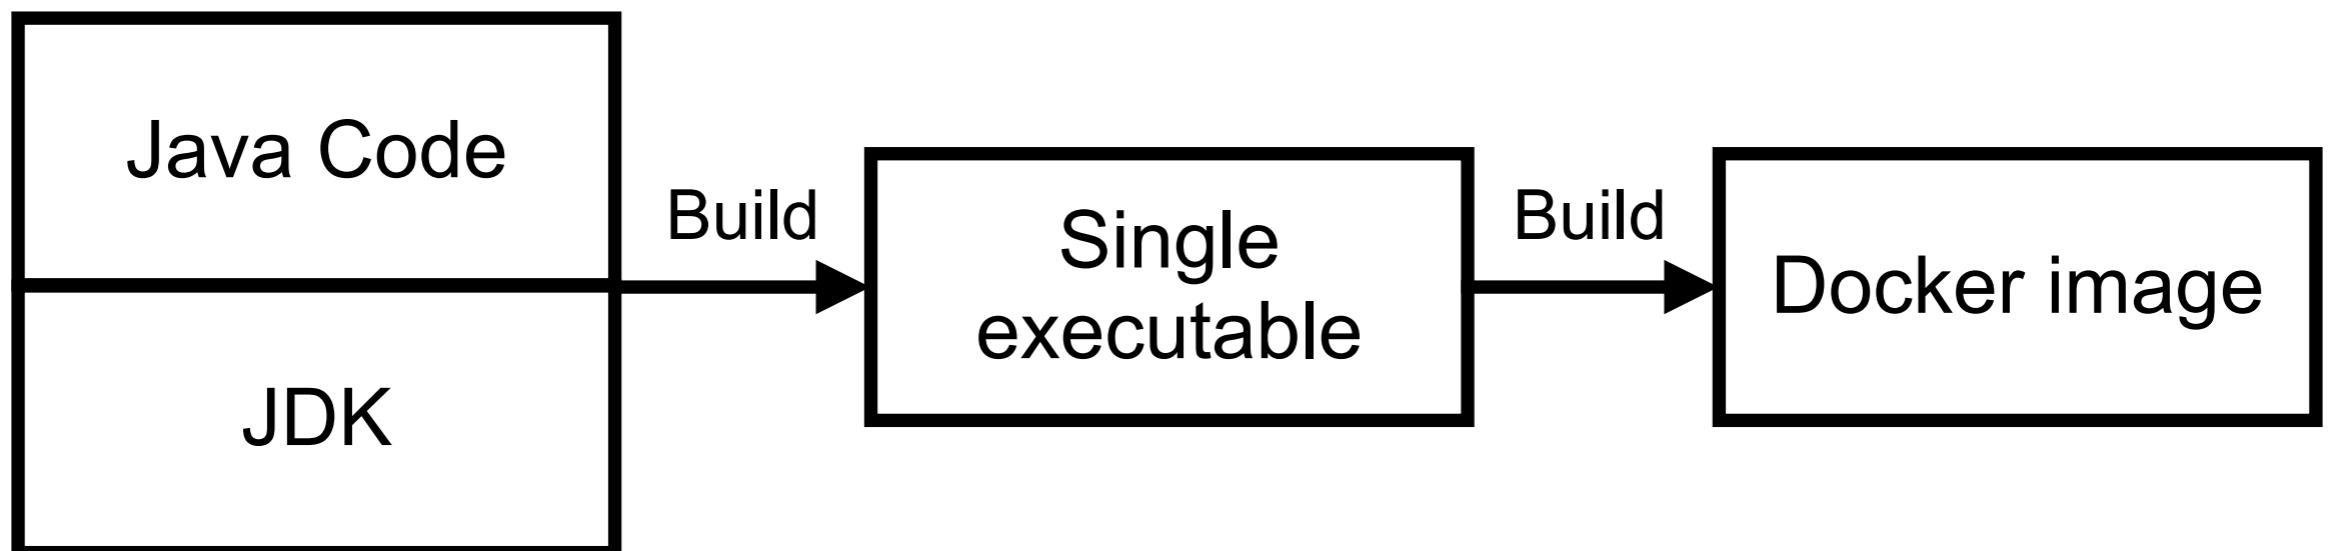

# How ?

# Traditional Deployment

# GraalVM Native Support

<https://www.graalvm.org/>

# Add to Spring Boot project

The screenshot shows the Spring Initializr web application. On the left, there are sections for 'Project' (Gradle - Groovy selected), 'Language' (Java selected), and 'Spring Boot' (3.1.4 selected). On the right, a red dashed box highlights the 'Dependencies' section, which includes 'GraalVM Native Support' (selected) under 'DEVELOPER TOOLS'. Below it, a note says 'Support for compiling Spring applications to native executables using the GraalVM native-image compiler.' At the bottom, the title '1. GraalVM support' is displayed in large red text.

## Dependencies

[ADD DEPENDENCIES...](#) 36 + 3

### Spring Web WEB

Build web, including RESTful applications using Spring MVC. Uses Apache Tomcat as the default embedded container.

### H2 Database SQL

Provides a fast in-memory database that supports JDBC API and H2DBC access, with a small (2mb) footprint. Supports embedded and server modes as well as a browser based console application.

### Spring Data JPA SQL

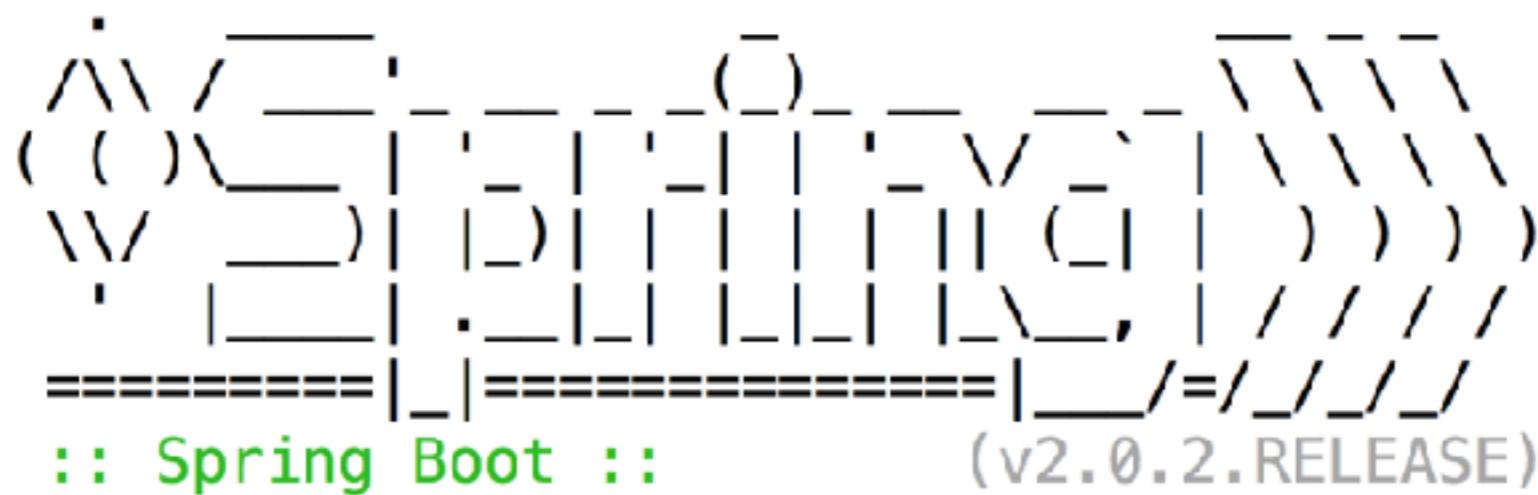

Persist data in SQL stores with Java Persistence API using Spring Data and Hibernate.

1. Spring Web
2. Spring Data JPA
3. H2 Database

# Run project (Dev mode)

```

# Convert in IntelliJ IDEA

The screenshot shows the IntelliJ IDEA plugin marketplace interface. A red dashed box highlights the search results for 'convert YAML'. The results list includes:

- Convert YAML and Properties File** by chencn (111.9K downloads, 3.49 rating) - **Install** button
- Properties to YAML Converter** by Jakub Kubrynski (103.4K downloads, 3.50 rating) - **Install** button
- convert yaml to properties** by zhang min (11.3K downloads, 1.90 rating) - **Install** button
- JSON-YAML-XML Converter** by Syncro Soft (2.6K downloads, 3.57 rating) - **Paid** badge, **Install** button
- Format-converter** by Dmitrii\_Priporov (596 downloads, 4.47 rating) - **Install** button

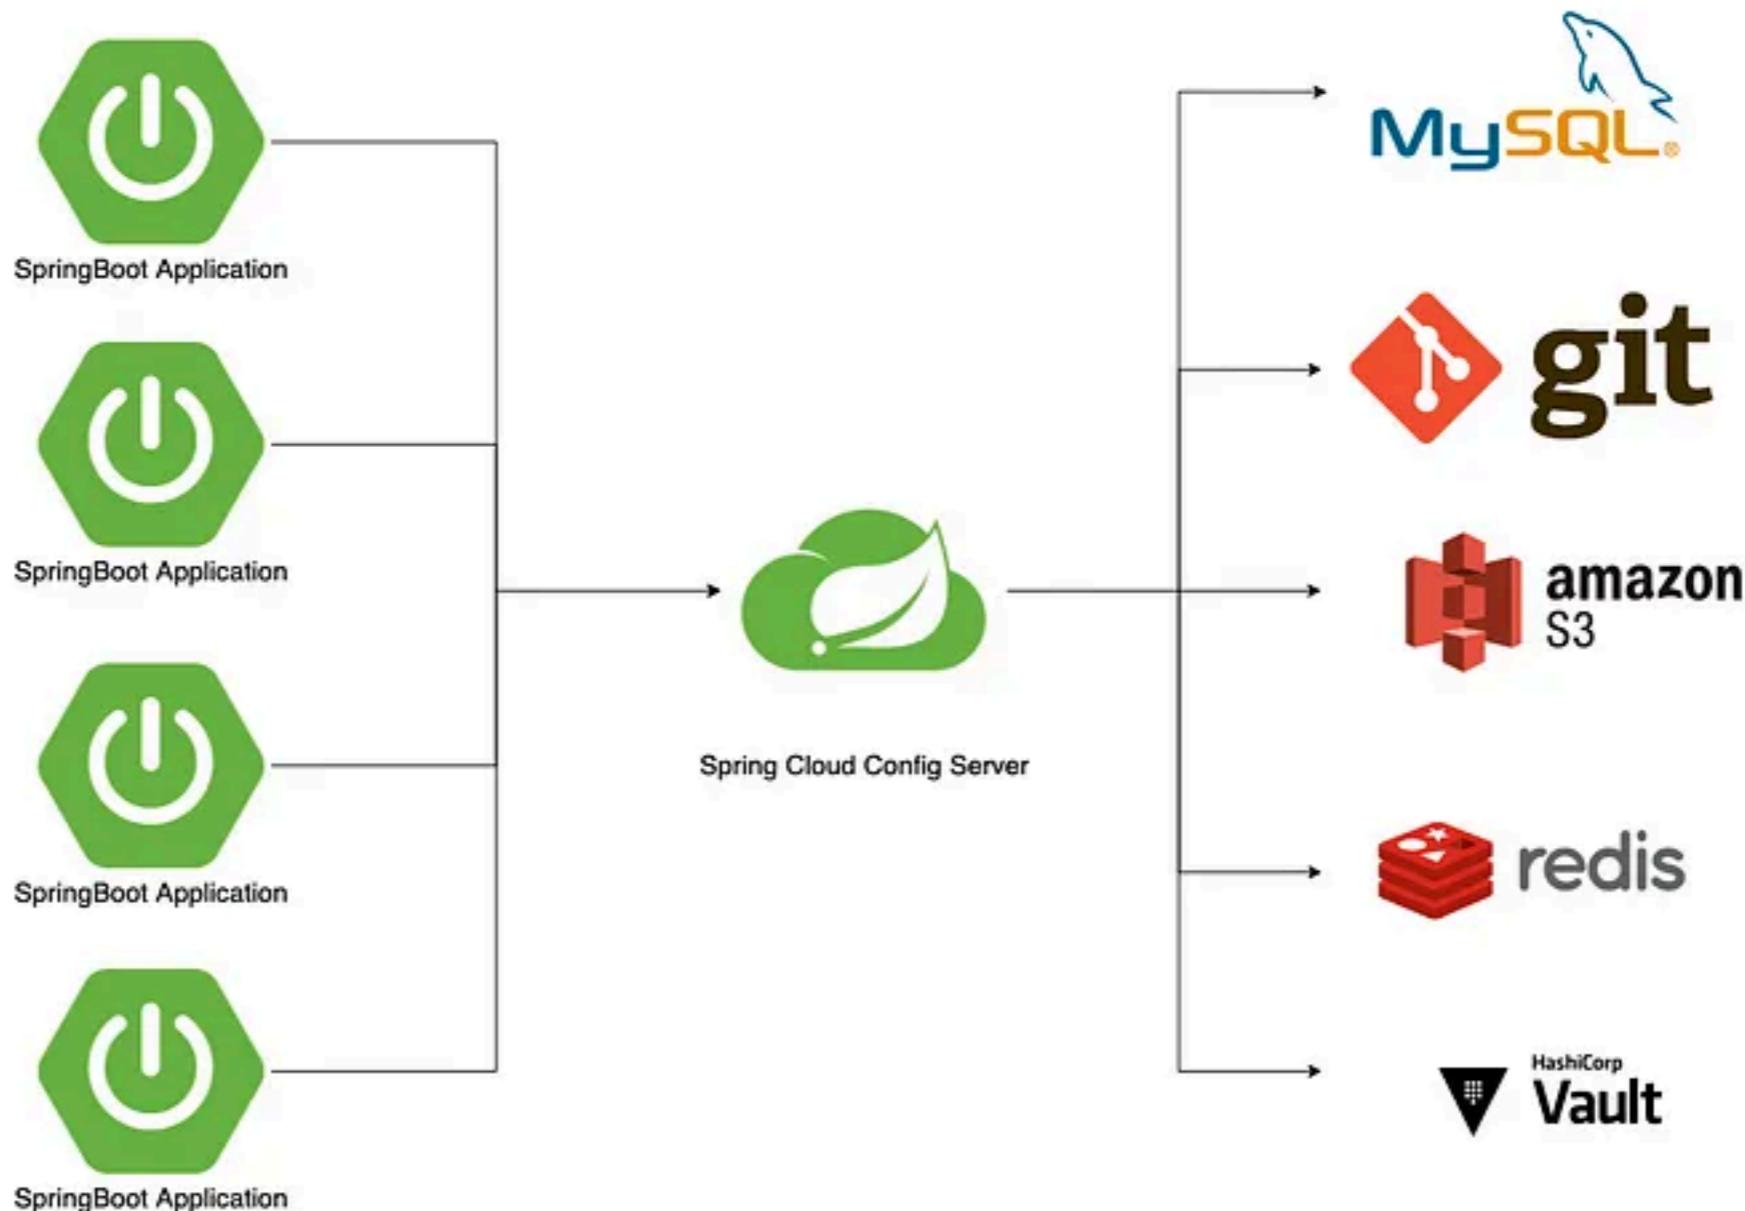

A second red dashed box highlights the details page for the first result, 'Convert YAML and Properties File'. The page includes:

- Code Tools** category
- Convert YAML and Properties File** by chencn
- Plugin homepage** link
- Install** button (disabled)
- 1.0.5** version
- Reviews** and **Additional Info** sections
- Overview** tab (selected)
- What's New** tab
- Screenshot of the plugin's interface showing file conversion logic.

# Centralized Configuration

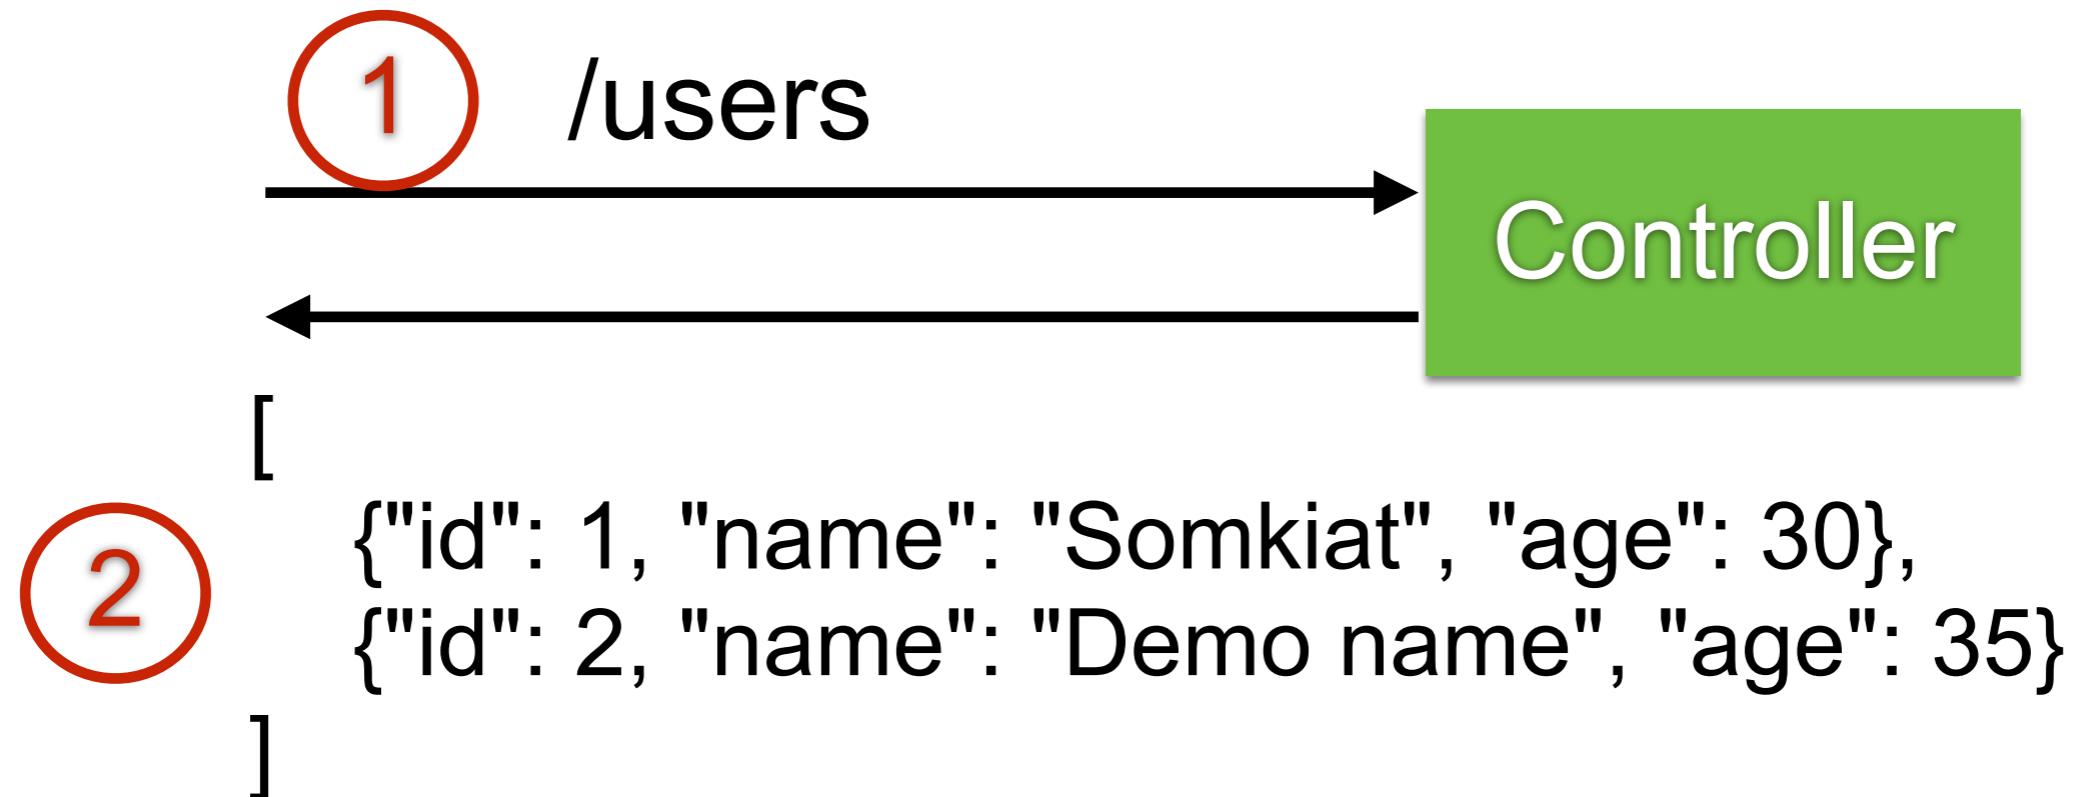

<https://spring.io/projects/spring-cloud-config>

# Basic structure of Spring Boot

# Get all users

# 1. Create REST Controller

## UserController.java

```
@RestController
public class UserController {

    @GetMapping("/users")
    public List<UserResponse> getAllUsers() {
        List<UserResponse> userResponseList = new ArrayList<>();
        userResponseList.add(new UserResponse(1, "demo 1", 30));
        userResponseList.add(new UserResponse(2, "demo 2", 35));
        return userResponseList;
    }
}
```

# 2. Create model class

## UserResponse.java

```
public class UserResponse {  
    private int id;  
    private String name;  
    private int age;  
  
    public UserResponse() {  
    }  
  
    public UserResponse(int id, String name, int age) {  
        this.id = id;  
        this.name = name;  
        this.age = age;  
    }  
}
```

# 3. Compile and Packaging

\$mvnw clean package

# 4. Run

```
$java -jar target/hello.jar
```

# 5. Open in browser

<http://localhost:8080/users>

```
[  
  {  
    "id": 1,  
    "name": "demo 1",  
    "age": 30  
  },  
  {  
    "id": 2,  
    "name": "demo 2",  
    "age": 35  
  }]  
]
```

# Create more APIs

Get user by id

Create a new user

Update user by id

Delete user by id

# Get user by id

GET /users/{id}

```
@GetMapping("/users/{id}")
public UserResponse getUserById(
    @PathVariable int id) {

    UserResponse userResponse = new UserResponse(id, "Demo", 40);
    return userResponse;
}
```

# Create UserResponse

# IntelliJ IDEA plug-in

The screenshot shows the IntelliJ IDEA plugin marketplace interface. A red dashed box highlights the search results for 'lombok'. The first result, 'Lombok' by JetBrains s.r.o., is selected and shown in detail on the right. The detail view includes the plugin's name, version (4.04), download count (14.6M), developer (JetBrains s.r.o.), a 'Disable' button, and a version number (232.9921.47). Below the main search results, there are other listed plugins: 'Lombok Builder Helper' by dorukguner, 'Kfang Agent Lombok' by KFANG AGENT, 'RoboPOJOGenerator' by Vadim Shchenev, 'Lombok HermitCrab' by 1747533293, and 'GsonFormatPlus' by sun-men. Each plugin entry has an 'Install' button.

## IntelliJ Lombok plugin

A plugin that adds first-class support for Project Lombok Features

- @Getter and @Setter
- @FieldNameConstants
- @ToString
- @EqualsAndHashCode
- @AllArgsConstructor, @RequiredArgsConstructor and @NoArgsConstructor

<https://plugins.jetbrains.com/plugin/6317-lombok>

# Use Lombok

```
@Data  
@Builder  
@NoArgsConstructor  
@AllArgsConstructor  
public class UserRequest {  
    private String email;  
    private String password;  
}
```

# Create more controller ..

# Create a new user

POST /users

```
@PostMapping("/users")
public UserResponse createNewUser(
    @RequestBody UserRequest newUser) {
    UserResponse newUserResponse = new UserResponse(
        1,
        newUser.getName(),
        newUser.getAge());
    return newUserResponse;
}
```

# Update user by id

PUT /users/{id}

```
@PutMapping("/users/{id}")
public UserResponse updateUser(@RequestBody UserRequest newUser,
                               @PathVariable int id) {
    // TODO
    // 1. find by id
    // 2. found => update user
    // 3. not found => ?? (create ? or throw error)
    UserResponse updatedUserResponse = new UserResponse(
        id,
        newUser.getName(),
        newUser.getAge());
    return updatedUserResponse;
}
```

# Delete user by id

DELETE /users/{id}

```
@DeleteMapping("/users/{id}")
public void deleteUser(@PathVariable int id) {
    // TODO
}
```

# API Documentation

# Swagger/ Open API

The screenshot shows the official Swagger website. At the top, there's a navigation bar with links for Learn, Tools, Resources, a search bar, Sign In, and Try Free. Below the header, a large green banner reads "API Development for Everyone". Underneath, a sub-section says "Simplify your API development with our open-source and professional tools, built to help you and your team efficiently design and document APIs at scale." To the right, a sidebar lists various API resources and methods: Servers (https://api.swagger.io), API Resources (Find your tool, Read the docs →), and Methods (GET, POST, PUT, PATCH, DELETE, OPTIONS, HEAD). The main content area also features logos for Microsoft, National Geographic, and Zuora under the heading "TRUSTED BY".

# 1. SpringBootTest

# SpringBootTest #1

```
@RunWith(SpringRunner.class)
@SpringBootTest(webEnvironment
        = SpringBootTest.WebEnvironment.RANDOM_PORT)
public class HelloControllerTest {

    @Autowired
    private TestRestTemplate testRestTemplate;

    @Test
    public void sayHi() {
        // Action :: Call controller
        Hello actualResult
            = testRestTemplate.getForObject("/hello/somkiat",
                                            Hello.class);

        // Assertion :: Check result with expected result
        assertEquals("Hello, somkiat", actualResult.getMessage());
    }
}
```

# SpringBootTest #2

```
@RunWith(SpringRunner.class)
@SpringBootTest(webEnvironment
        = SpringBootTest.WebEnvironment.RANDOM_PORT)
public class HelloControllerTest {

    @Autowired
    private TestRestTemplate testRestTemplate;

    @Test
    public void sayHi() {
        // Action :: Call controller
        Hello actualResult
            = testRestTemplate.getForObject("/hello/somkiat",
                Hello.class);

        // Assertion :: Check result with expected result
        assertEquals("Hello, somkiat", actualResult.getMessage());
    }
}
```

# SpringBootTest #3

```
@RunWith(SpringRunner.class)
@SpringBootTest(webEnvironment
        = SpringBootTest.WebEnvironment.RANDOM_PORT)
public class HelloControllerTest {

    @Autowired
    private TestRestTemplate testRestTemplate;

    @Test
    public void sayHi() {
        // Action :: Call controller
        Hello actualResult
                = testRestTemplate.getForObject("/hello/somkiat",
                                                Hello.class);

        // Assertion :: Check result with expected result
        assertEquals("Hello, somkiat", actualResult.getMessage());
    }
}
```

# 2. Slice Testing with MockMVC

# 2. Slice Testing with MockMVC

# MockMvcTest #1

```
@RunWith(SpringRunner.class)
@WebMvcTest(NumberController.class)
public class NumberControllerMockMvcTest {

    @MockBean
    private MyRandom stubRandom;

    @Autowired
    private MockMvc mvc;

    @Test
    public void success() throws Exception {
        NumberControllerResponse expected
            = new NumberControllerResponse("5555");

        // Stub
        given(stubRandom.nextInt(10)).willReturn(5555);
    }
}
```

# MockMvcTest #2

```
@RunWith(SpringRunner.class)
@WebMvcTest(NumberController.class)
public class NumberControllerMockMvcTest {

    @MockBean
    private MyRandom stubRandom;

    @Autowired
    private MockMvc mvc;

    @Test
    public void success() throws Exception {
        NumberControllerResponse expected
            = new NumberControllerResponse("5555");

        // Stub
        given(stubRandom.nextInt(10)).willReturn(5555);

        // ...
    }
}
```

# MockMvcTest #3

## Use ObjectMapper to convert JSON to object

```
// Call API HTTP response code = 200
String response =
    this.mvc.perform(get("/number"))
    .andExpect(status().isOk())
    .andReturn()
    .getResponse().getContentAsString();

// Convert JSON message to Object
ObjectMapper mapper = new ObjectMapper();
NumberControllerResponse actual =
    mapper.readValue(response,
        NumberControllerResponse.class);
```

# 3. Unit testing with Controller

# Unit test

Use Test Double

In java, use Mockito library

<http://site.mockito.org/>

# Unit testing with Mockito #1

```
@ExtendWith(MockitoExtension.class)
public class NumberControllerUnitTest {

    @Mock
    private MyRandom stubRandom;

    @Test
    public void success() throws Exception {
        NumberControllerResponse expected
            = new NumberControllerResponse("5555");

        // Stub
        given(stubRandom.nextInt(10)).willReturn(5555);
    }
}
```

# Unit testing with Mockito #2

```
@ExtendWith(MockitoExtension.class)
public class NumberControllerUnitTest {

    @Mock
    private MyRandom stubRandom;

    @Test
    public void success() throws Exception {
        NumberControllerResponse expected
            = new NumberControllerResponse("5555");

        // Stub
        given(stubRandom.nextInt(10)).willReturn(5555);
    }
}
```

# Unit testing with Mockito #3

```
@Test
public void success() throws Exception {
    NumberControllerResponse expected
        = new NumberControllerResponse("5555");

    // Stub
    given(stubRandom.nextInt(10)).willReturn(5555);

    // Call
    NumberController controller = new NumberController(stubRandom);
    NumberControllerResponse actual = controller.randomNumber();

    // Assert
    assertEquals("5555", actual.getValue());
    assertEquals(expected, actual);
}

# ProblemDetail

Enable ProblemDetail for error by default

## application.properties

```
spring.mvc.problemdetails.enabled=true
```

# Example in ControllerAdvice

```
@RestControllerAdvice
class HelloControllerAdvice {

    @ExceptionHandler(InvalidInputException.class)
    public ProblemDetail handleInvalidInputException(
        InvalidInputException e, WebRequest request) {

        ProblemDetail problemDetail
            = ProblemDetail
                .forStatusAndDetail(HttpStatus.BAD_REQUEST, e.getMessage());
        problemDetail.setInstance(URI.create("demo-instance"));
        problemDetail.setTitle("demo");

        return problemDetail;
    }
}
```

# Error handling

```
@Service
public class UserService {

    private AccountRepository accountRepository;

    @Autowired
    public UserService(AccountRepository accountRepository) {
        this.accountRepository = accountRepository;
    }

    public Account getAccount(int id) {
        Optional<Account> account = accountRepository.findById(id);
        if(account.isPresent()) {
            return account.get();
        }
        throw new MyAccountNotFoundException(
            String.format("Account id=[%d] not found", id));
    }
}
```

# MyAccountNotFoundException

```
public class MyAccountNotFoundException  
    extends RuntimeException {
```

```
    public MyAccountNotFoundException(String message) {  
        super(message);  
    }
```

```
}
```

# Response Status

404 = Not Found

Status	Description
400	Request body doesn't meet API spec
401	Authentication/Authorization fail
403	User can't perform the operation
404	Resource does not exist
405	Unsupported operation
500	Error on server

# Handling error in Spring Boot

```
@RestControllerAdvice  
public class AccountControllerHandler {  
  
    @ExceptionHandler(MyAccountNotFoundException.class)  
    public ResponseEntity<ExceptionResponse> accountNotFound(  
        MyAccountNotFoundException exception) {

# Code coverage

**"Code coverage can show the high risk areas in a program, but never the risk-free."**

Paul Reilly, 2018, Kotlin TDD with Code Coverage

# Code coverage

A tool to measure how much of your code is covered by tests that break down into classes, methods and lines.

# Code coverage

But 100% of code coverage **does not mean** that your code is 100% correct

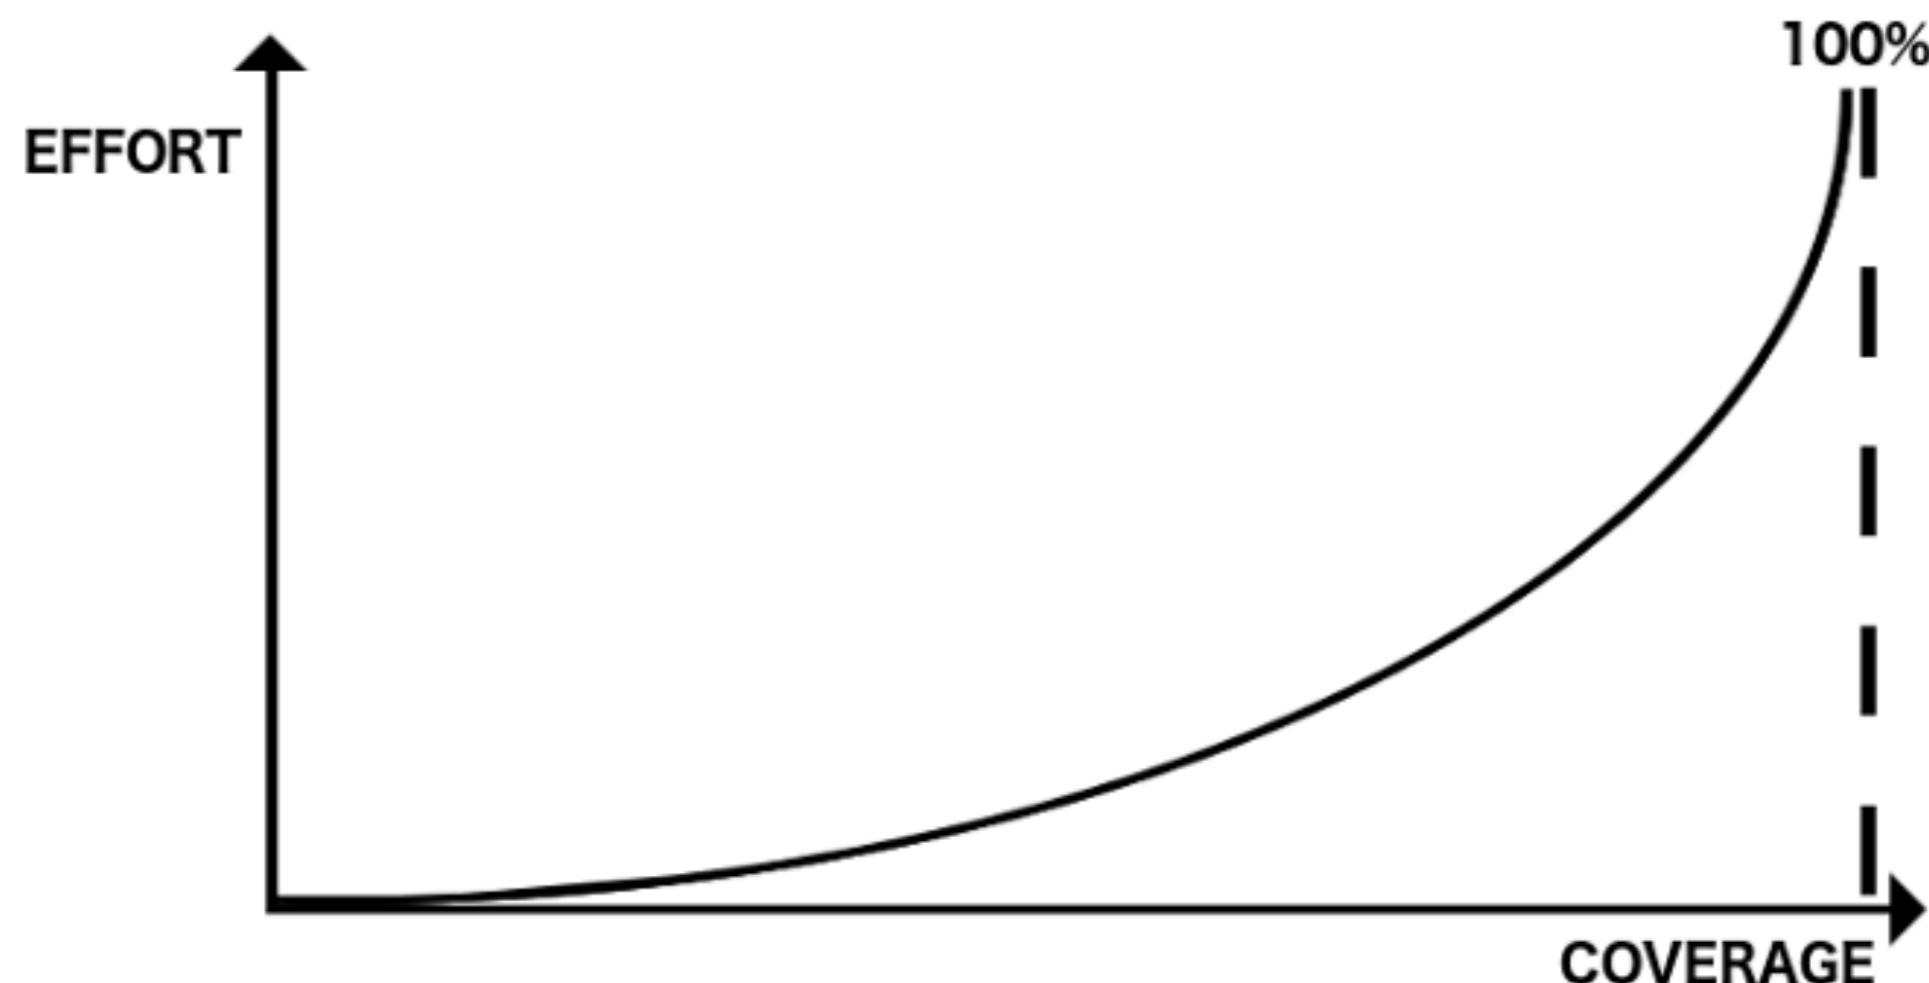

# Code coverage

Powerful tool to improve the quality of your code

**Code coverage != quality of tests**

# Code coverage 100% ?

# % of Code/Test coverage

# Code coverage with Java

Testing

# Modify pom.xml

Add library of Spring Data JPA, PostgreSQL, H2

**Dependencies**

**ADD DEPENDENCIES... ⌂ + B**

---

**PostgreSQL Driver** SQL

A JDBC and R2DBC driver that allows Java programs to connect to a PostgreSQL database using standard, database independent Java code.

---

**H2 Database** SQL

Provides a fast in-memory database that supports JDBC API and R2DBC access, with a small (2mb) footprint. Supports embedded and server modes as well as a browser based console application.

---

**Spring Data JPA** SQL

Persist data in SQL stores with Java Persistence API using Spring Data and Hibernate.

<https://start.spring.io/>

# Modify pom.xml

## H2 for testing

```
<dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-data-jpa</artifactId>
</dependency>
```

```
<dependency>
    <groupId>com.h2database</groupId>
    <artifactId>h2</artifactId>
    <scope>test</scope>
</dependency>
```

```
<dependency>
    <groupId>org.postgresql</groupId>
    <artifactId>postgresql</artifactId>
    <scope>runtime</scope>
</dependency>
```

# Modify pom.xml

## PostgreSQL for production

# How to testing repository ?

# Repository Testing

Using `@DataJpaTest` (slice testing)

Working with In-memory database

# Repository Testing #1

## Setup test with @DataJpaTest

```
@RunWith(SpringRunner.class)
@DataJpaTest
public class PersonRepositoryTest {

    @Autowired
    private PersonRepository repository;

    @After
    public void tearDown() throws Exception {
        repository.deleteAll();
    }

}
```

# Repository Testing #2

## Auto wired repository for testing

```
@RunWith(SpringRunner.class)
@DataJpaTest
public class PersonRepositoryTest {

    @Autowired
    private PersonRepository repository;

    @After
    public void tearDown() throws Exception {
        repository.deleteAll();
    }

}
```

# Repository Testing #3

Clear data in table after executed each test case

```
@RunWith(SpringRunner.class)
@DataJpaTest
public class PersonRepositoryTest {

    @Autowired
    private PersonRepository repository;

    @After
    public void tearDown() throws Exception {
        repository.deleteAll();
    }

}
```

# Repository Testing #3

Write your first test case

```
@Test  
public void should_save_fetch_a_person() {  
  
    Person somkiat = new Person("Somkiat", "Pui");  
    repository.save(somkiat);  
  
    Optional<Person> maybeSomkiat  
        = repository.findByLastName("Pui");  
  
    assertEquals(maybeSomkiat, Optional.of(somkiat));  
}
```

# Run test

## \$mvnw clean test

Hibernate: drop table person if exists

Hibernate: drop sequence if exists hibernate\_sequence

Hibernate: create sequence hibernate\_sequence start with 1 increment by 1

Hibernate: create table person (id varchar(255) not null, first\_name varchar(255), last\_name varchar(255), primary key (id))

Insert data

Hibernate: call next value for hibernate\_sequence

Hibernate: insert into person (first\_name, last\_name, id) values (?, ?, ?)

Hibernate: select person0\_.id as id1\_0\_, person0\_.first\_name as first\_na2\_0\_, person0\_.last\_name as last\_nam3\_0\_ from person person0\_ where person0\_.last\_name=?

2

Query data

Hibernate: drop table person if exists

Hibernate: drop sequence if exists hibernate\_sequence

# Use case 1

Integrate repository with controller

3. HelloController

2. PersonRepository

4. PersonResponse

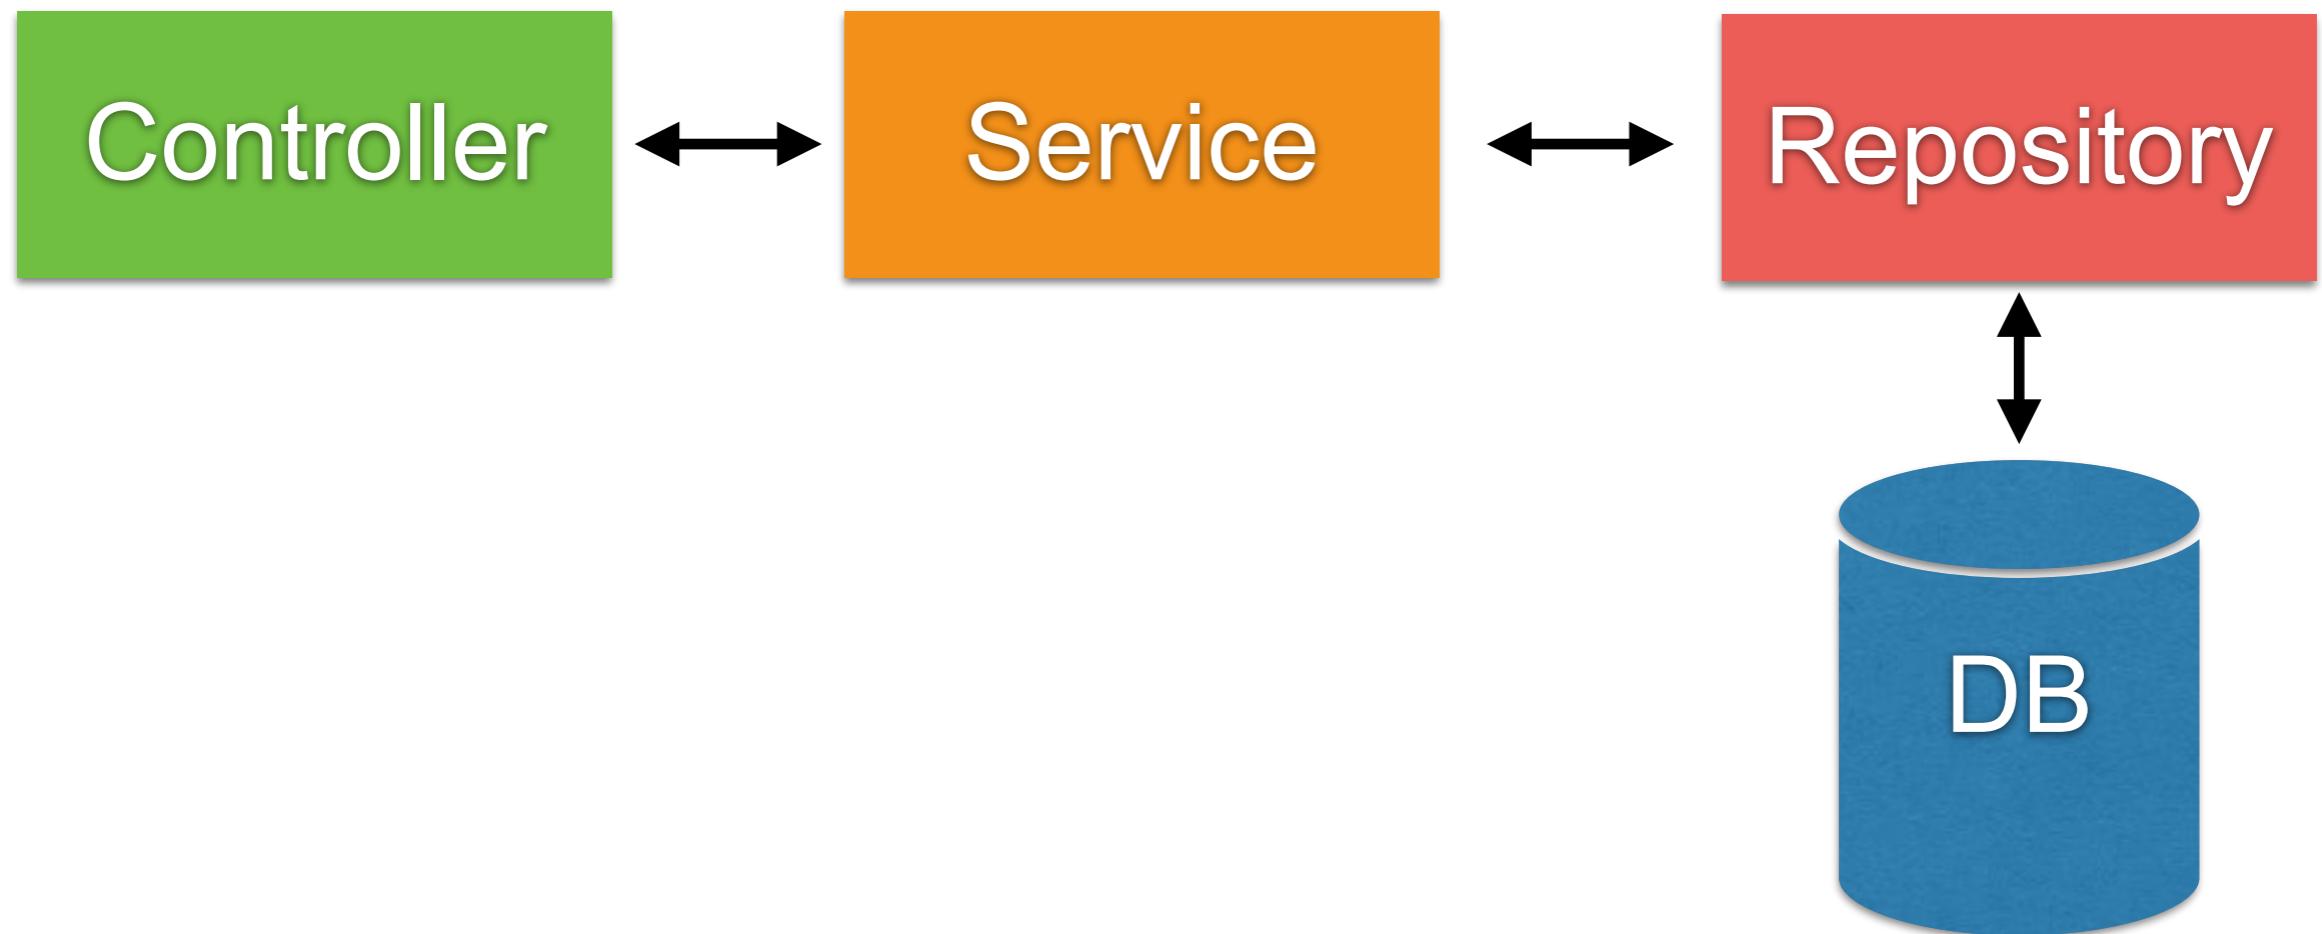

1. Person

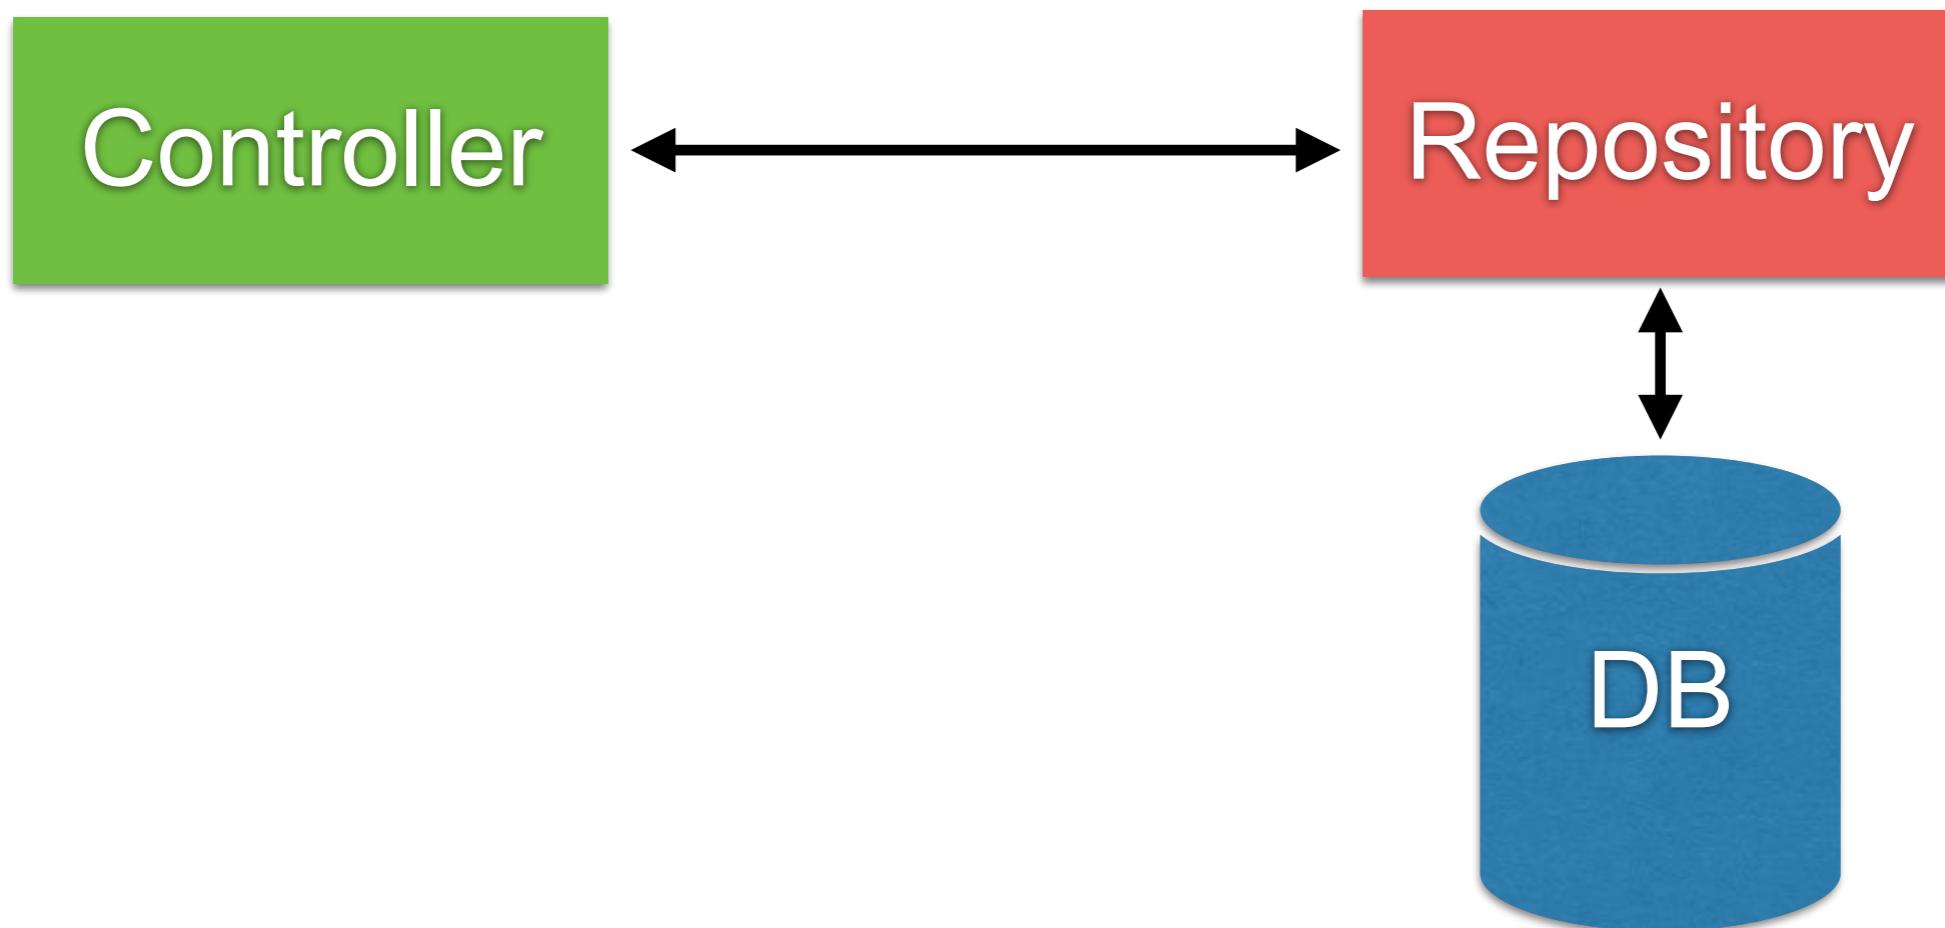

# **Integrate repository with service/controller**

# Service use repository ?

# Controller use repository ?

# Controller call repository

## Create HelloController.java

```
@RestController
public class HelloController {

    private final PersonRepository personRepository;

    @Autowired
    public HelloController(final PersonRepository personRepository) {
        this.personRepository = personRepository;
    }
}
```

# Controller call repository

## Create HelloController.java

```
@GetMapping("/hello/{lastName}")
public HelloResponse hello(@PathVariable final String lastName) {

    Optional<Person> foundPerson
        = personRepository.findByLastName(lastName);

    return foundPerson
        .map(person ->
            new HelloResponse(person.getFirstName(),
                person.getLastName()))
        .orElseThrow(() -> new RuntimeException());
}
```

# Run spring boot

\$mvnw spring-boot:run

# Fix !!!

# Use case 2

## Working with API

# Use case 2

## Working with API

# JSON Place Holder

<https://jsonplaceholder.cypress.io/posts/1>

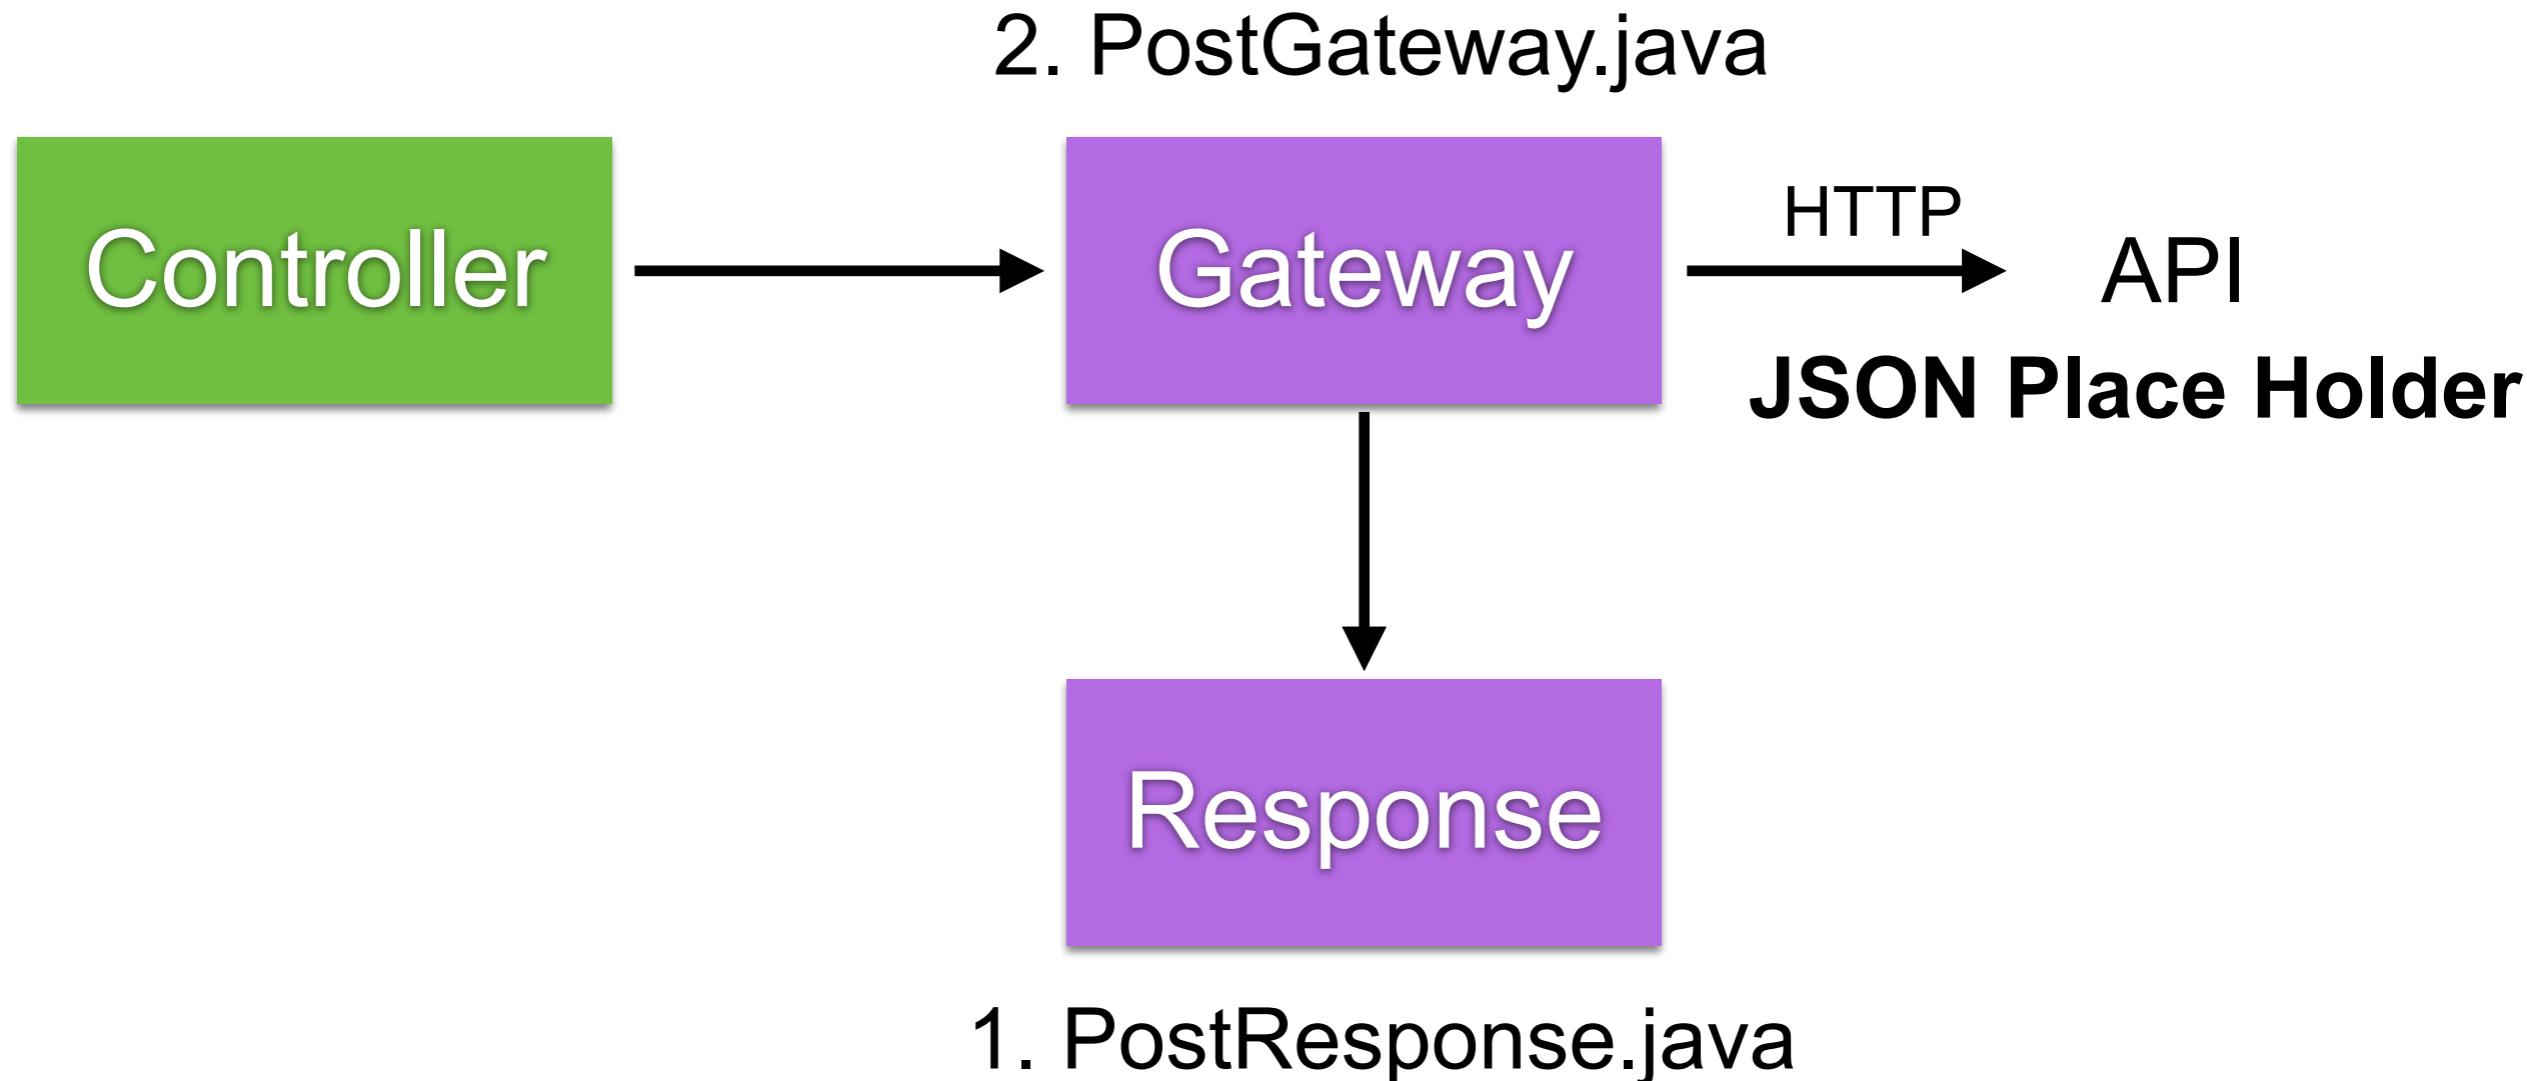

The screenshot shows a web-based API testing interface for JSONPlaceholder. At the top, the title "JSONPlaceholder" is displayed in large, bold letters. Below it, a subtitle reads "Fake Online REST API for Testing and Prototyping" and "Powered by [JSON Server + LowDB](#)". A code block in the center contains the following JavaScript code:

```
fetch('https://jsonplaceholder.cypress.io/todos/1')
  .then(response => response.json())
  .then(json => console.log(json))
```

At the bottom of the interface is a blue button labeled "Try it".

# Prometheus

The screenshot shows the official Prometheus website. At the top, there's a dark navigation bar with the Prometheus logo, a search bar, and social media links for GitHub and Twitter. The main heading "From metrics to insight" is prominently displayed in white on an orange background. Below it, a subtitle reads "Power your metrics and alerting with the leading open-source monitoring solution." Two buttons, "GET STARTED" and "DOWNLOAD", are visible. The bottom section features four cards with icons and descriptions: "Dimensional data" (Prometheus implements a highly dimensional data model), "Powerful queries" (PromQL allows slicing and dicing of collected time series data), "Great visualization" (Prometheus has multiple modes for visualizing data), and "Efficient storage" (Prometheus stores time series in memory and on local disk in an efficient custom format). Each card also includes a detailed paragraph.

- Dimensional data**  
Prometheus implements a highly dimensional data model. Time series are identified by a metric name and a set of key-value pairs.
- Powerful queries**  
PromQL allows slicing and dicing of collected time series data in order to generate ad-hoc graphs, tables, and alerts.
- Great visualization**  
Prometheus has multiple modes for visualizing data: a built-in expression browser, Grafana integration, and a console template language.
- Efficient storage**  
Prometheus stores time series in memory and on local disk in an efficient custom format. Scaling is achieved by functional sharding and

# Centralized logging

Log service activity and write logs into a centralized logging server. (searching, alerting)

# Effective Logging

Define event to log

Use structured logging

Exclude sensitive information

Log at the correct level

Be specific in your message

Don't log large message

Make sure you keep trace Id in the log

[https://github.com/OWASP/CheatSheetSeries/blob/master/cheatsheets/Logging\\_Cheat\\_Sheet.md](https://github.com/OWASP/CheatSheetSeries/blob/master/cheatsheets/Logging_Cheat_Sheet.md)

# Consistent Structure across all logs

Property	Description	Example
<b>Timestamp</b>	Date and time of the log	2023-07-01
<b>Log level</b>	DEBUG, INFO, ERROR	
<b>Trace Id or Correlation Id</b>	Unique identifier that refer to other logs from all services	
<b>Event/Action Name</b>	Identify to event or action of log	Authentication fail
<b>Service ID/ Name</b>	Identify to service	
<b>Request path</b>	Path for the request	/api/products

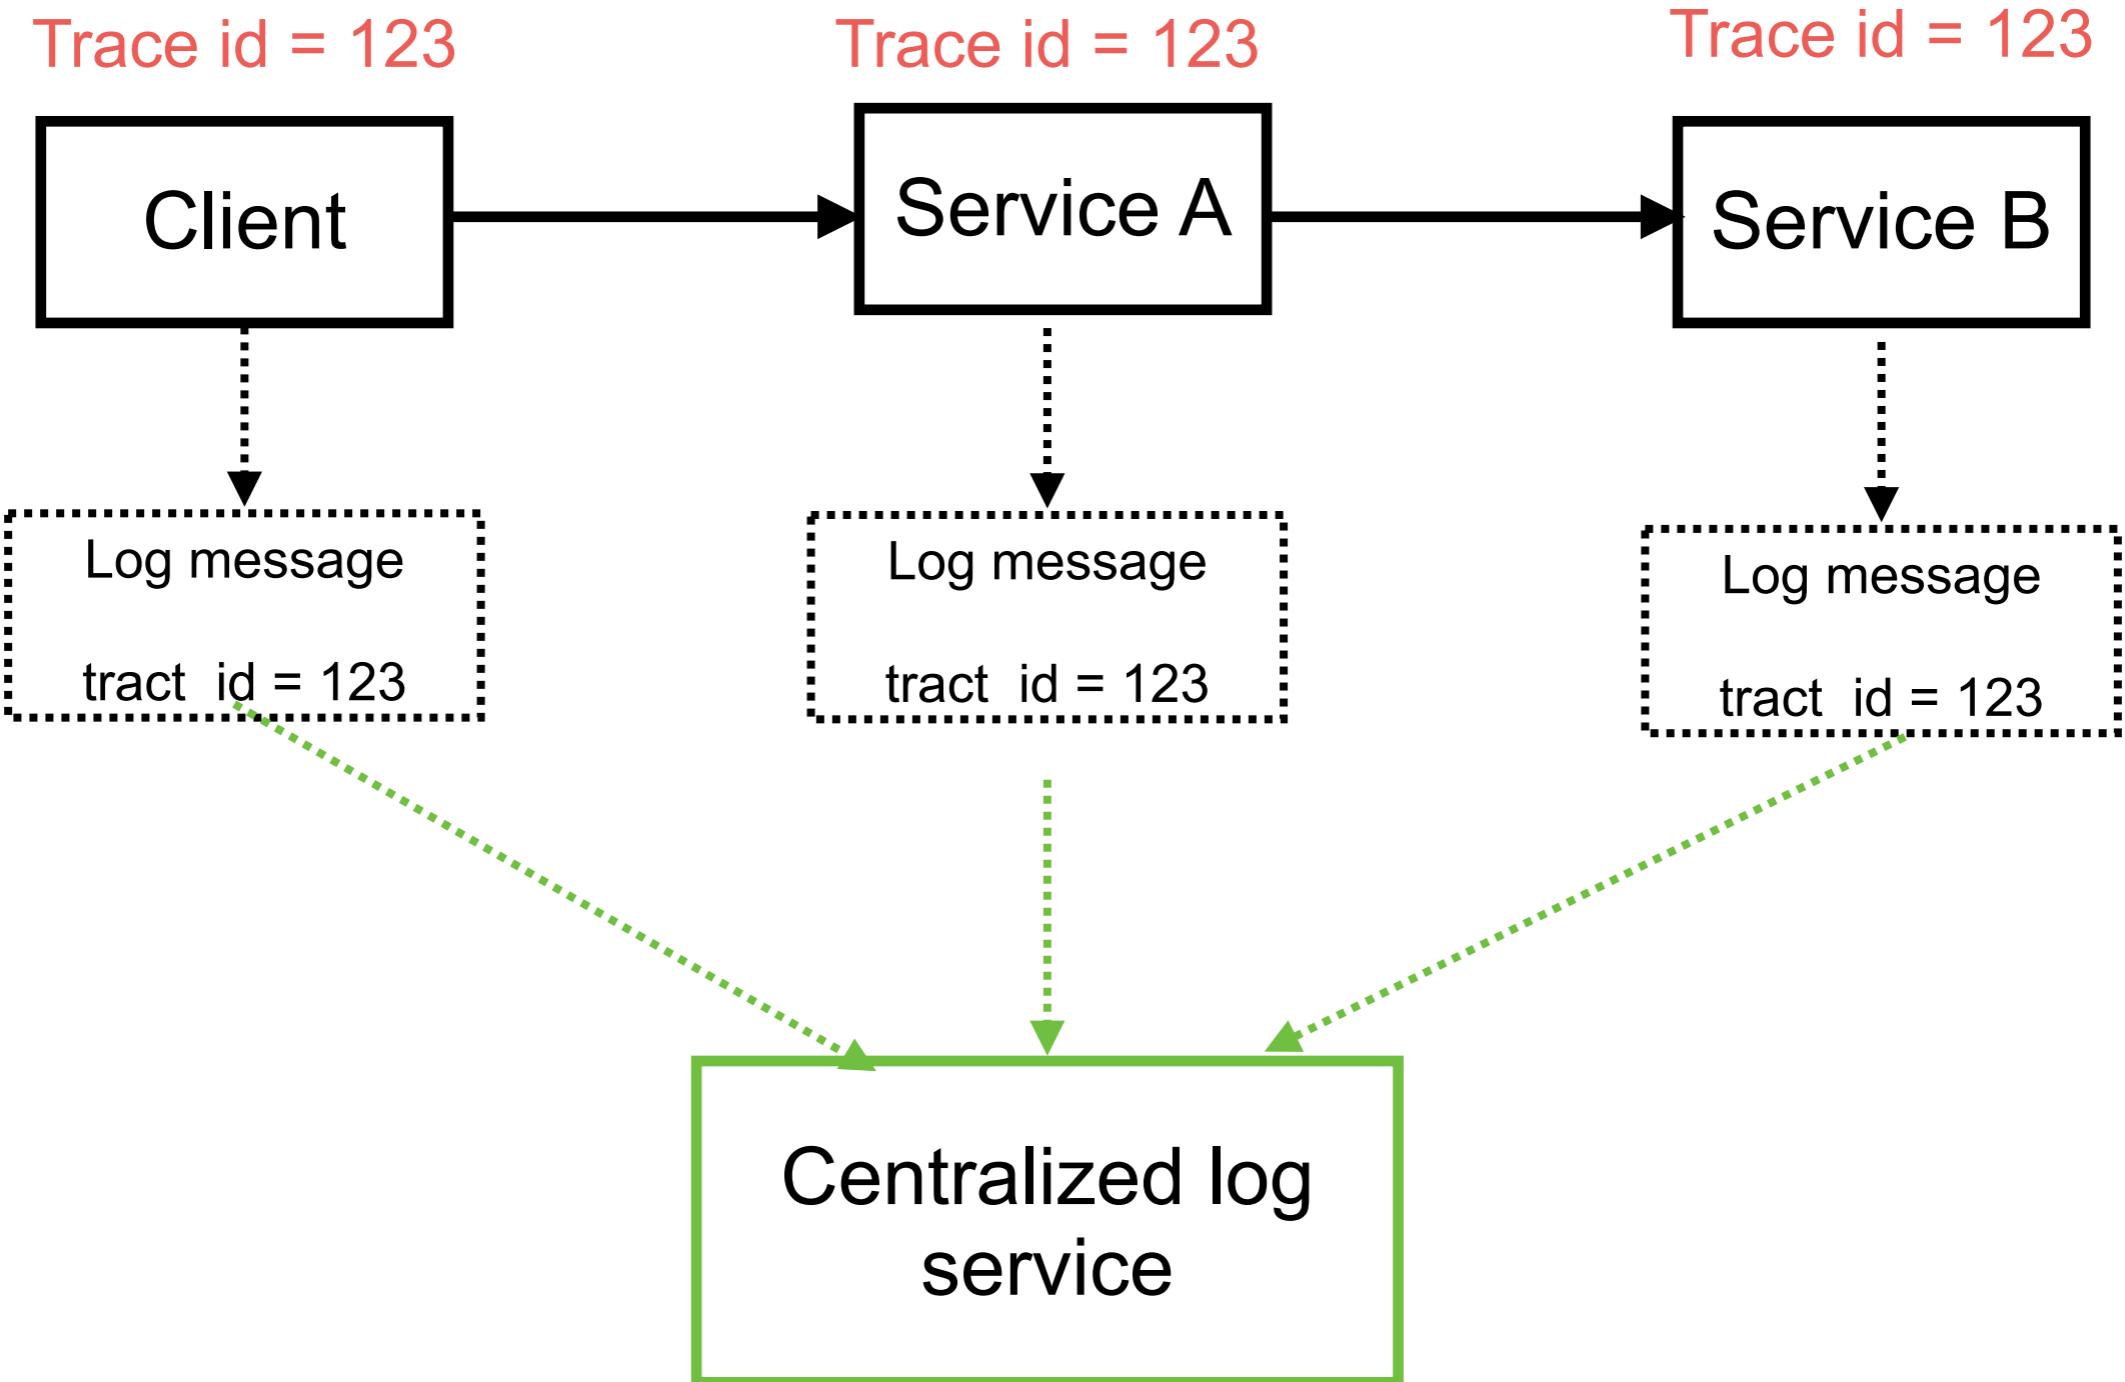

# Don't keep !!

## TypeScript is JavaScript with syntax for types.

TypeScript is a strongly typed programming language that builds on JavaScript, giving you better tooling at any scale.

Try TypeScript Now

Online or via npm

...

[Editor Checks](#) [Auto-complete](#) [Interfaces](#) [JSX](#)

```
const user = {  
    firstName: "Angela",  
    lastName: "Davis",  
    role: "Professor",  
}
```

```
console.log(user.name)
```

Property 'name' does not exist on type '{  
 firstName: string; lastName: string; role:  
 string; }'.

Design patterns

# Key idea of TypeScript

It adds **static-typing** to JavaScript

More maintainable

Easy to learn and use

# Software Requirements

NodeJS 18+

The screenshot shows the official Node.js website at <https://nodejs.org/en>. The main heading is "Run JavaScript Everywhere". Below it, a paragraph describes Node.js as a free, open-source, cross-platform JavaScript runtime environment. A green button labeled "Download Node.js (LTS)" is visible. To the right, a code editor window displays a script named "server.mjs" for creating an HTTP server. The code uses ES6 syntax like import statements and arrow functions. Below the code, there are tabs for "JavaScript" and a "Copy to clipboard" button. A search bar and navigation menu are also present at the top.

```
1 // server.mjs
2 import { createServer } from 'node:http';
3
4 const server = createServer((req, res) =>
5   res.writeHead(200, { 'Content-Type': 'text/plain' });
6   res.end('Hello World!\n');
7 );
8
9 // starts a simple http server locally on
10 server.listen(3000, '127.0.0.1', () => {
11   console.log('Listening on 127.0.0.1:3000');
12 });
13
14 // run with 'node server.mjs'
```

let message: string = "Hello, World!";
console.log(message);
```

# Variable Declarations

var , let, const

	var	let	const
Stored in Global Scope	✓	✗	✗
Function Scope	✓	✓	✓
Block Scope	✗	✓	✓
Can Be Reassigned?	✓	✓	✗
Can Be Redeclared?	✓	✗	✗
Can Be Hoisted?	✓	✗	✗

# Function declaration

```
// Simple function
function add(a: number, b: number): number {
    return a + b;
}

// Arrow function
const add2 = (a: number, b: number): number => a + b;
```

# Data Types

```
let isDone: boolean = false;
let decimal: number = 6;
let color: string = "blue";
let myTuple: [string, number] = ["hello", 10];
let myArray: number[] = [1, 2, 3];
let myObject: { name: string, age: number }
  = { name: "John", age: 30 };

let myAny: any = 4;
let nothing: undefined = undefined;
let myNull: null = null;
```

# Custom Object Types

```
// Type declaration
type Person = {name: string, age?: number, email?: string};

// Variable declaration
let p1: Person = {name: 'demo', };
let p2: Person = {name: 'demo', age: 23};
let p3: Person = {name: 'demo', age: 23, email: ''};

p1.name = "new name";
p1.age = 30;
```

# Object-Oriented Programming

## Class Interface

# Class

## Blueprint for creating objects

```
class Person {  
    name: string;  
    age: number;  
  
    constructor(name: string, age: number) {  
        this.name = name;  
        this.age = age;  
    }  
  
    greet() {  
        console.log(`Hello, my name is ${this.name} and I'm ${this.age} years old.`);  
    }  
}  
  
let john = new Person("John", 30);  
john.greet();
```

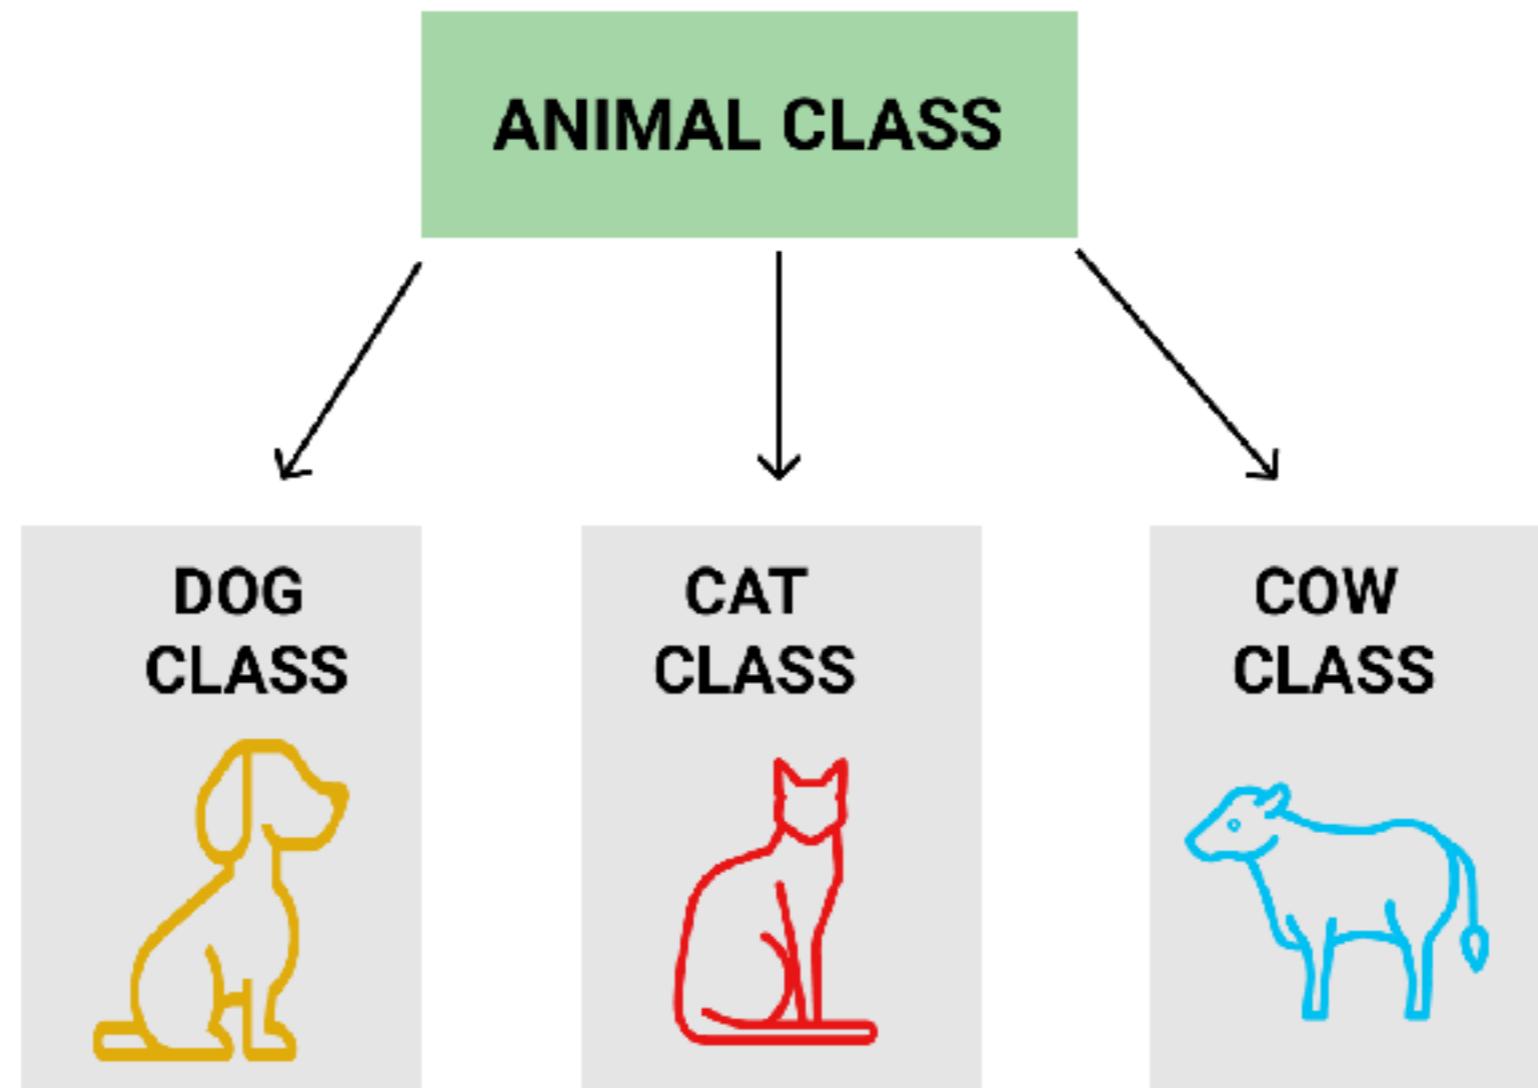

# Class

## Shorthand constructor

```
class Person {  
  constructor(public name: string, public age: number) {}  
  greet() {  
    console.log(`Hello, my name is ${this.name} and I'm ${this.age} years  
old.`);  
  }  
}  
  
let john = new Person("John", 30);  
john.greet();
```

# Inheritance

# Visibility of class member

Public (default)

Protected

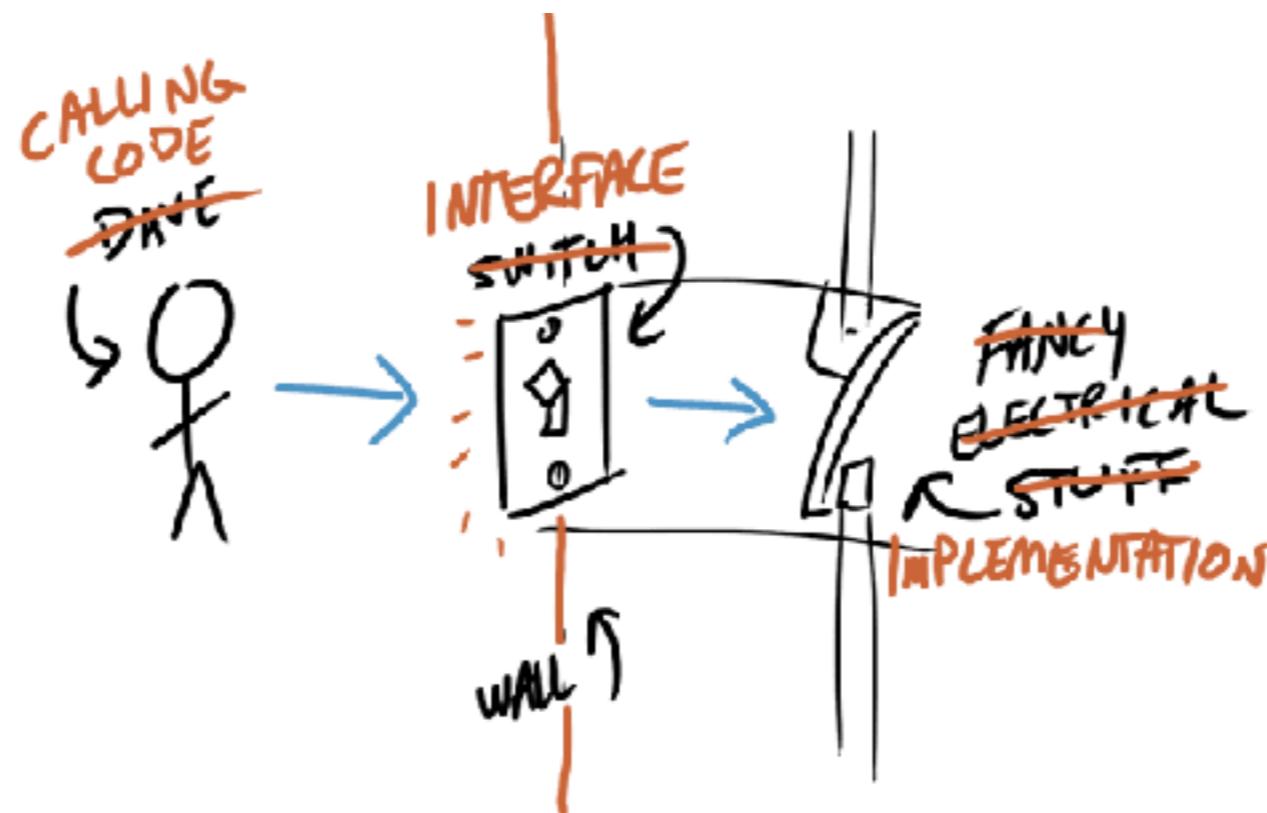

Private

Readonly

# Interface (Encapsulation)

Contract for a class or function  
Can't create an object/instance  
Used for type checking

# Interface

```
interface IPerson {  
    name: string;  
    age: number;  
    greet(): void;  
}
```

```
class Person implements IPerson {  
    name: string;  
    age: number;  
  
    constructor(name: string, age: number) {  
        this.name = name;  
        this.age = age;  
    }  
  
    greet() {  
        ...  
    }  
}
```

# Generic

Use in function and class  
Reusable and flexible !!

```
class QueueV1 {  
    private items: string[];  
  
    constructor() {  
        this.items = [];  
    }  
  
    push = (newItem: string) => this.items.push(newItem);  
    pop = () => this.items.shift();  
}
```

# Generic

Improve code with Generic way

```
class QueueWithGeneric<T> {
    private items: T[];

    constructor() {
        this.items = [];
    }

    push = (newItem: T) => this.items.push(newItem);
    pop = () => this.items.shift();
}
```

# Mapped types

Pick

Partial

Readonly

<https://www.typescriptlang.org/docs/handbook/2/mapped-types.html>

# Pick some properties

```
type User = {  
    id: string,  
    name: string,  
    age: number  
};  
  
type NewUserData = Pick<User, 'name'>;  
const user1: NewUserData = { name: 'John' };  
  
const user2: User = {  
    ...user1,  
    id: '1',  
    age: 20  
};
```

[https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Operators/Spread\\_syntax](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Operators/Spread_syntax)

# Partial

```
type User = {  
    id: string,  
    name: string,  
    age: number  
};  
  
type PartialUser = Partial<User>;  
const user1: PartialUser = {  
    name: 'John',  
};
```

[https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Operators/Spread\\_syntax](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Operators/Spread_syntax)

# ReadOnly

```
type ReadonlyUser = Readonly<User>;  
  
const user2: ReadonlyUser = {  
  id: '123',  
  name: 'John',  
  age: 30  
};  
  
user2.age = 31; // Error: Cannot assign to 'age'  
// because it is a read-only property.
```

# DBML (Database Markup Language)

## DBML - Database Markup Language

Open source

2.4k

### Intro

DBML (Database Markup Language) is an open-source DSL language designed to define and document database schemas and structures. It is designed to be simple, consistent and highly-readable.

It also comes with command-line tool and open-source module to help you convert between DBML and SQL.

# GoReleaser

The screenshot shows the GoReleaser landing page. At the top left is the title "GoReleaser". Below it is the tagline "Release Go projects as fast and easily as possible!". A list of features follows: "With GoReleaser, you can:"

- Cross-compile your Go project
- Release to GitHub, GitLab and Gitea
- Create nightly builds
- Create Docker images and manifests
- Create Linux packages and Homebrew taps
- Sign artifacts, checksums and container images
- Announce new releases on Twitter, Slack, Discord and others
- Generate SBOMs (Software Bill of Materials) for binaries and container images
- ... and much more!

At the bottom left are two buttons: "Get started" and "Get Pro". To the right is a circular logo featuring a blue Go gopher character riding a white rocket ship against a dark blue background with stars. The word "GORELEASER" is written in white at the bottom of the circle.

# Go Doc

The screenshot shows a web browser window displaying the Go Documentation Server at `localhost:6060/pkg/`. The title bar says "Go Documentation Server". A search bar is at the top right. On the left, there's a sidebar with links: "Standard library", "Other packages", "Sub-repositories", and "Community". On the right, there's a cartoon character of a penguin wearing a hard hat. The main content area has a blue header "Standard library ▾". Below it is a table:

Name	Synopsis
<a href="#">archive</a>	
<a href="#">tar</a>	Package tar implements access to tar archives.
<a href="#">zip</a>	Package zip provides support for reading and writing ZIP archives.
<a href="#">arena</a>	The arena package provides the ability to allocate memory for a collection of Go values and free that space manually all at once, safely.
<a href="#">bufio</a>	Package bufio implements buffered I/O. It wraps an io.Reader or io.Writer object, creating another object (Reader or Writer) that also implements the interface but provides buffering and some help for textual I/O.
<a href="#">builtin</a>	Package builtin provides documentation for Go's predeclared identifiers.
<a href="#">bytes</a>	Package bytes implements functions for the manipulation of byte slices.
<a href="#">compress</a>

# Convert JSON to Go Struct

The screenshot shows the quicktype.io interface. On the left, there's a sidebar with a 'Name' input field containing 'Welcome' and a 'Source type' dropdown set to 'JSON'. Below this is a text area with a JSON sample:

```
[{"greeting": "Welcome to quicktype!", "instructions": ["Type or paste JSON here", "Or choose a sample above", "quicktype will generate code in your chosen language to parse the sample data"]}]
```

The main panel displays the generated Go code:

```
// This file was generated from JSON Schema using quicktype, do not modify it directly.  
// To parse and unparse this JSON data, add this code to your project:  
//  
// welcome, err := UnmarshalWelcome(bytes)  
// bytes, err = welcome.Marshal()  
  
package main  
  
import "encoding/json"  
  
func UnmarshalWelcome(data []byte) (Welcome, error) {  
    var r Welcome  
    err := json.Unmarshal(data, &r)  
    return r, err  
}  
  
func (r *Welcome) Marshal() ([]byte, error) {  
    return json.Marshal(r)  
}  
  
type Welcome struct {  
    Greeting string `json:"greeting"  
    Instructions []string `json:"instructions"  
}
```

On the right, there are settings for the generated package: 'Language' is set to 'Go', 'Generated package name' is 'main', and several optional checkboxes are available: 'Plain types only', 'Renders each top-level object in its own Go file', 'Plain types with package only', and 'Make all properties optional'. A 'Copy Code' button is also present.

```
package main

import "fmt"

type THB int

func (thb THB) String() string {
    return fmt.Sprintf("%d THB", thb)
}
```

<https://pkg.go.dev/fmt#Stringer>

# Workshop with Struct

## Create struct and receiver

```
type Banking struct {
    balance THB
}

func (b *Banking) Balance() THB {
    return b.balance
}

func (b *Banking) Deposit(amount THB) {
    b.balance += amount
}

func (b *Banking) Withdraw(amount THB) {
    b.balance -= amount
}
```

# How to testing ?

# Testing with Deposit

```
func TestBankingDeposit(t *testing.T) {
    // Arrange
    banking := Banking{}
    // Act
    banking.Deposit(THB(1000))
    got := banking.Balance()
    // Assert
    want := THB(1000)
    if got != want {
        t.Errorf("got %s want %s", got, want)
    }
}
```

```
$go test -v
```

# Testing with Withdraw

```
func TestBankingWithdraw(t *testing.T) {
    // Arrange
    banking := Banking{
        balance: 5000,
    }
    // Act
    banking.Withdraw(THB(1000))
    got := banking.Balance()
    // Assert
    want := THB(4000)
    if got != want {
        t.Errorf("got %s want %s", got, want)
    }
}
```

```
$go test -v
```

# Try by yourself

## Remove pointer (\*)

```
type Banking struct {
    balance THB
}

func (b Banking) Balance() THB {
    return b.balance
}

func (b Banking) Deposit(amount THB) {
    b.balance += amount
}

func (b Banking) Withdraw(amount THB) {
    b.balance -= amount
}
```

```
$go test -v
```

# Result !!

```
---- FAIL: TestBankingDeposit (0.00s)
  banking_test.go:16: got 0 THB want 1000 THB
---- FAIL: TestBankingWithdraw (0.00s)
  banking_test.go:31: got 5000 THB want 4000 THB
FAIL
exit status 1
FAIL      demo      0.460s
```

## Why ?

# Print memory address

```
func (b Banking) Deposit(amount THB) {
    fmt.Printf("Address of balance in Deposit is %p \n", &b.balance)
    b.balance += amount
}
```

```
func TestBankingDeposit(t *testing.T) {
    // Arrange
    banking := Banking{}
    // Act
    ...
    fmt.Printf("Address of balance in Deposit is %p \n", &banking.balance)
    ...
}
```

# Result

```
Address of balance in Deposit is 0x14000016128
Address of balance in Deposit is 0x14000016120
--- FAIL: TestBankingDeposit (0.00s)
    banking_test.go:18: got 0 THB want 1000 THB

# Add new feature with test ?

# Withdraw :: not enough money

```
func TestBanking(t *testing.T) {  
    t.Run("withdraw not enough money", func(t *testing.T) {  
        startingBalance := THB(1000)  
        b := Banking{startingBalance}  
        err := b.Withdraw(THB(2000))  
        assertBalance(t, b, startingBalance)  
        if err == nil {  
            t.Error("wanted an error but didn't get one")  
        }  
    })  
}
```

Return error !!

# Withdraw()

## Use errors package

```
func (b *Banking) Withdraw(amount THB) error {  
    if amount > b.balance {  
        return errors.New("Money not enough")  
    }  
  
    b.balance -= amount  
    return nil  
}
```

Return error

<https://pkg.go.dev/errors>

# Run test :: passed

# Refactor code

# Production code

## Define error into variable

```
var ErrNotEnoughMoney = errors.New("Cannot withdraw, money not enough")

func (b *Banking) Withdraw(amount THB) error {
    if amount > b.balance {
        return ErrNotEnoughMoney
    }

    b.balance -= amount
    return nil
}
```

<https://github.com/uber-go/guide/blob/master/style.md#errors>

# Test code

```
func TestBanking(t *testing.T) {  
    t.Run("withdraw not enough money", func(t *testing.T) {  
        startingBalance := THB(1000)  
        b := Banking{startingBalance}  
  
        err := b.Withdraw(THB(2000))  
  
        assertBalance(t, b, startingBalance)  
        if err == nil {  
            t.Error("wanted an error but didn't get one")  
        }  
    })  
}
```

# Assert with Error

```
func assertBalance(t testing.TB, b Banking, want THB) {
    t.Helper()
    got := b.Balance()

    if got != want {
        t.Errorf("got %q want %q", got, want)
    }
}

func assertError(t testing.TB, got, want error) {
    t.Helper()
    if got == nil {
        t.Fatal("didn't get an error but wanted one")
    }

    if got != want {
        t.Errorf("got %q, want %q", got, want)
    }
}
```

# Test code

```
t.Run("withdraw", func(t *testing.T) {
    b := Banking{balance: 5000}
    err := b.Withdraw(THB(1000))

    assertBalance(t, b, THB(4000))
    assertNoError(t, err)
})

t.Run("withdraw not enough money", func(t *testing.T) {
    startingBalance := THB(1000)
    b := Banking{startingBalance}
    err := b.Withdraw(THB(2000))

    assertBalance(t, b, startingBalance)
    assertError(t, err, ErrNotEnoughMoney)
})
```

# More testing library

<https://github.com/stretchr/testify>

# Error handling with Go

<https://go.dev/blog/error-handling-and-go>

# Build-in error type

```
func doSth() (result string, err error) {  
    return "", fmt.Errorf("Error")  
}
```

```
func main() {  
    result, err := doSth()  
    if err != nil {  
        fmt.Println(err)  
    }  
    fmt.Println("Result=", result)  
}
```

# Error handling

```
func doSth() (result string, err error) {  
    return "", fmt.Errorf("Error")  
}
```

```
func main() {  
    result, err := doSth()  
    if err != nil {  
        fmt.Println(err)  
    }  
    fmt.Println("Result=", result)  
}
```

# Error interface

```
type error interface {
    Error() string
}
```

```
type errorString struct {
    s string
}

func (e *errorString) Error() string {
    return e.s
}
```

# Custom error

```
type error interface {
    Error() string
}
```

```
type errorString struct {
    s string
}

func (e *errorString) Error() string {
    return e.s
}
```

# Errors package

Provide function to manipulate errors  
Use New() to create error

```
var ErrNotEnoughMoney = errors.New("Cannot withdraw, money not enough")

func (b *Banking) Withdraw(amount THB) error {
    if amount > b.balance {
        return ErrNotEnoughMoney
    }

    b.balance -= amount
    return nil
}
```

<https://pkg.go.dev/errors>

# Best practices for Error handling

Use `errors.New()` to create error

Wrap error with `fmt.Errorf()`

Return `nil` if everything is ok

Create **custom type** for error

Don't use `panic()` and `recover()`

**Check error immediately** after call function

Log error before return

<https://climbtheladder.com/10-golang-error-handling-best-practices/>

# Example with error

```
func main() {
    f, err := os.Open("filename.ext")
    if err != nil {
        log.Fatal(err)
    }
    defer f.Close()

    // do something with the open file

}

# Defer, Panic and Recover

## try/catch/finally

<https://go.dev/blog/defer-panic-and-recover>

# Defer, Panic and Recover

**Defer =>** put function call into a stack

**Panic =>** Stop the normal execution flow

**Recover =>** Handle panic, use with defer

```
func A() {
    defer fmt.Println("Called A")
    B()
}

func B() {
    defer fmt.Println("Called B")
    C()
}

func C() {
    defer fmt.Println("Called C")
    Break()
}
```

```
func Break() {
    defer fmt.Println("Called Break")
    panic(errors.New("My Error with panic"))

}

func main() {
    A()
}
```

# Working with Recover()

```
func A() {
    defer fmt.Println("Called A")

    defer func() {
        if x := recover(); x != nil {
            fmt.Printf("Panic: %+v\n", x)
        }
    }()
}

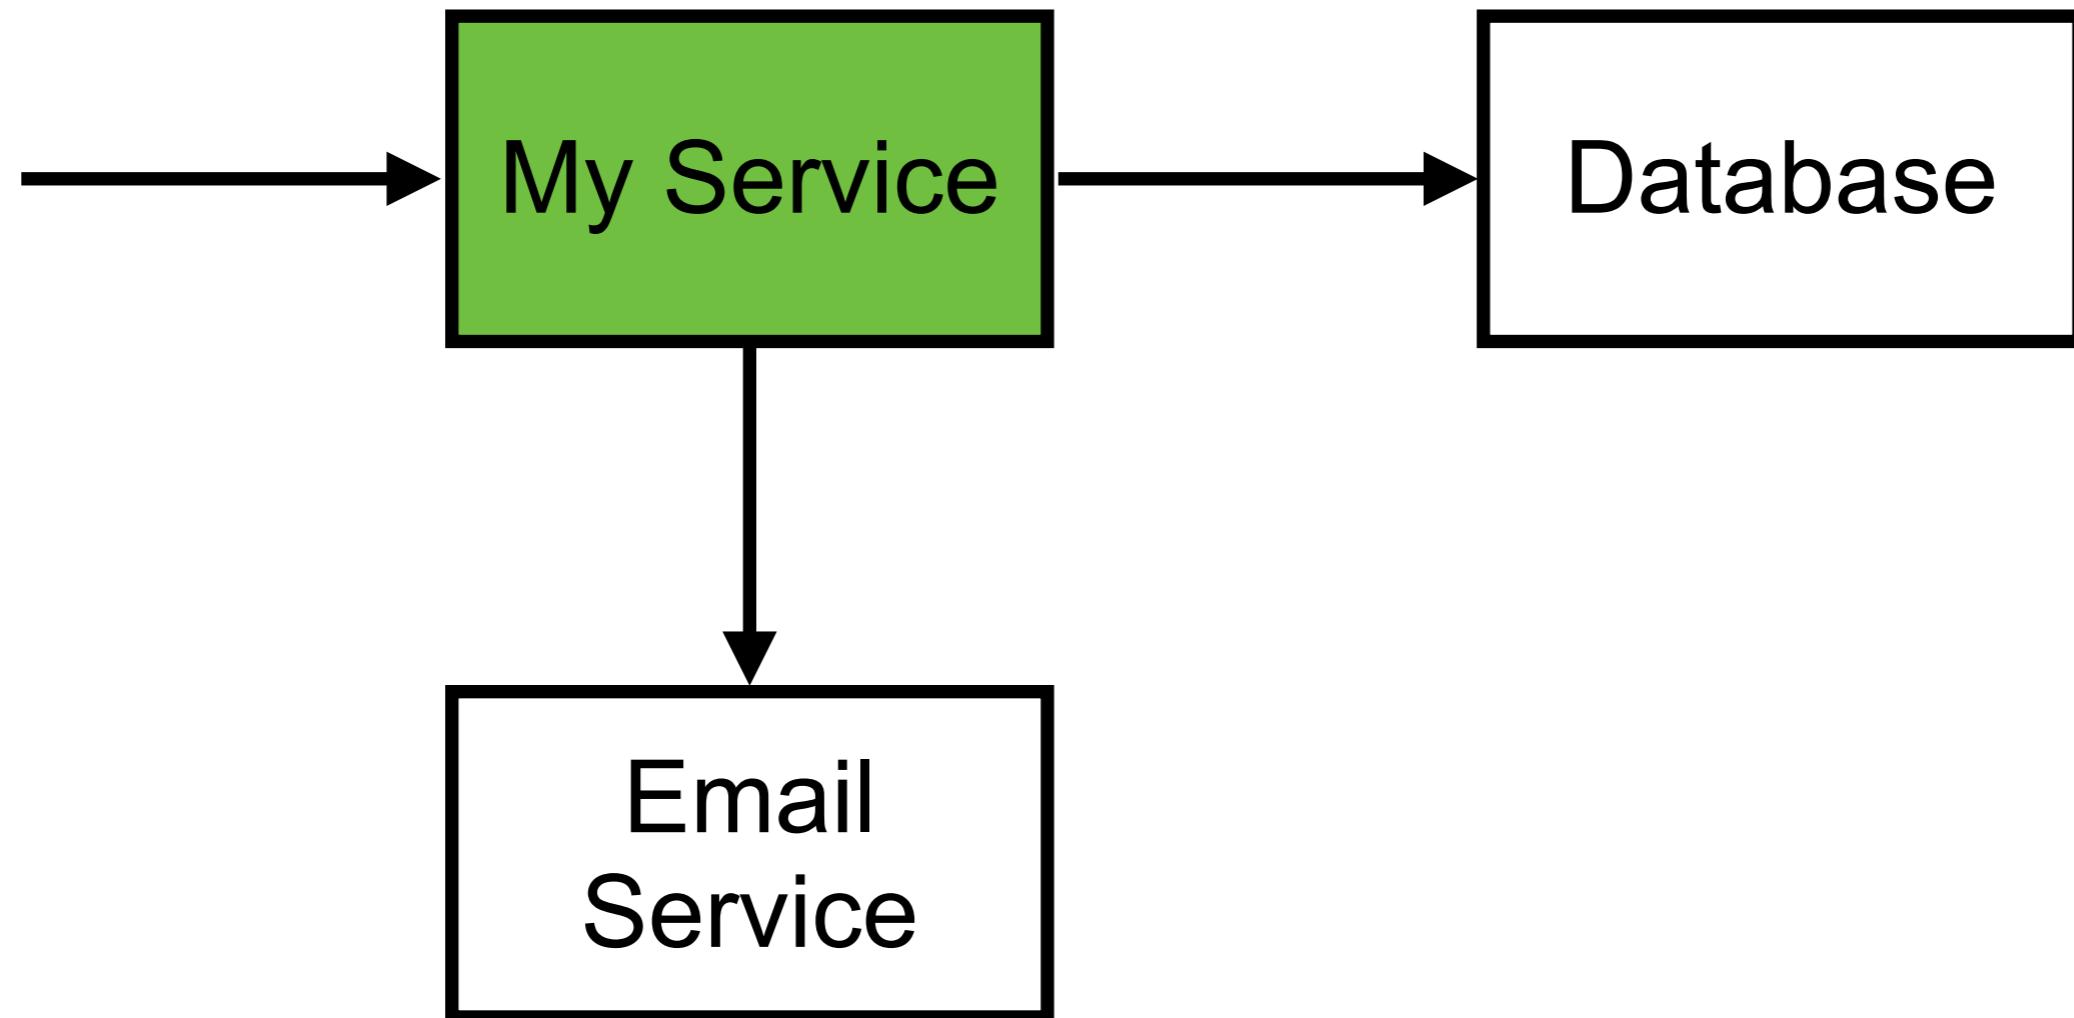

B()
}
```

# **Project structure with Testable !!**

# Structure of project

# Let's Start

```
type MyService struct {  
}  
  
func (s *MyService) Process() error {  
    // 1. Create database connection  
    // 2. Insert data into database  
    // 3. Create email service  
    // 4. Send email  
}
```

# Design with struct

```
type Database struct {  
}  
  
func (d *Database) connect() error {  
    return nil  
}  
func (d *Database) insertData() error {  
    return nil  
}
```

```
type EmailService struct {  
}  
  
func (e *EmailService) connect() error {  
    return nil  
}  
  
func (e *EmailService) send() error {  
    return nil  
}
```

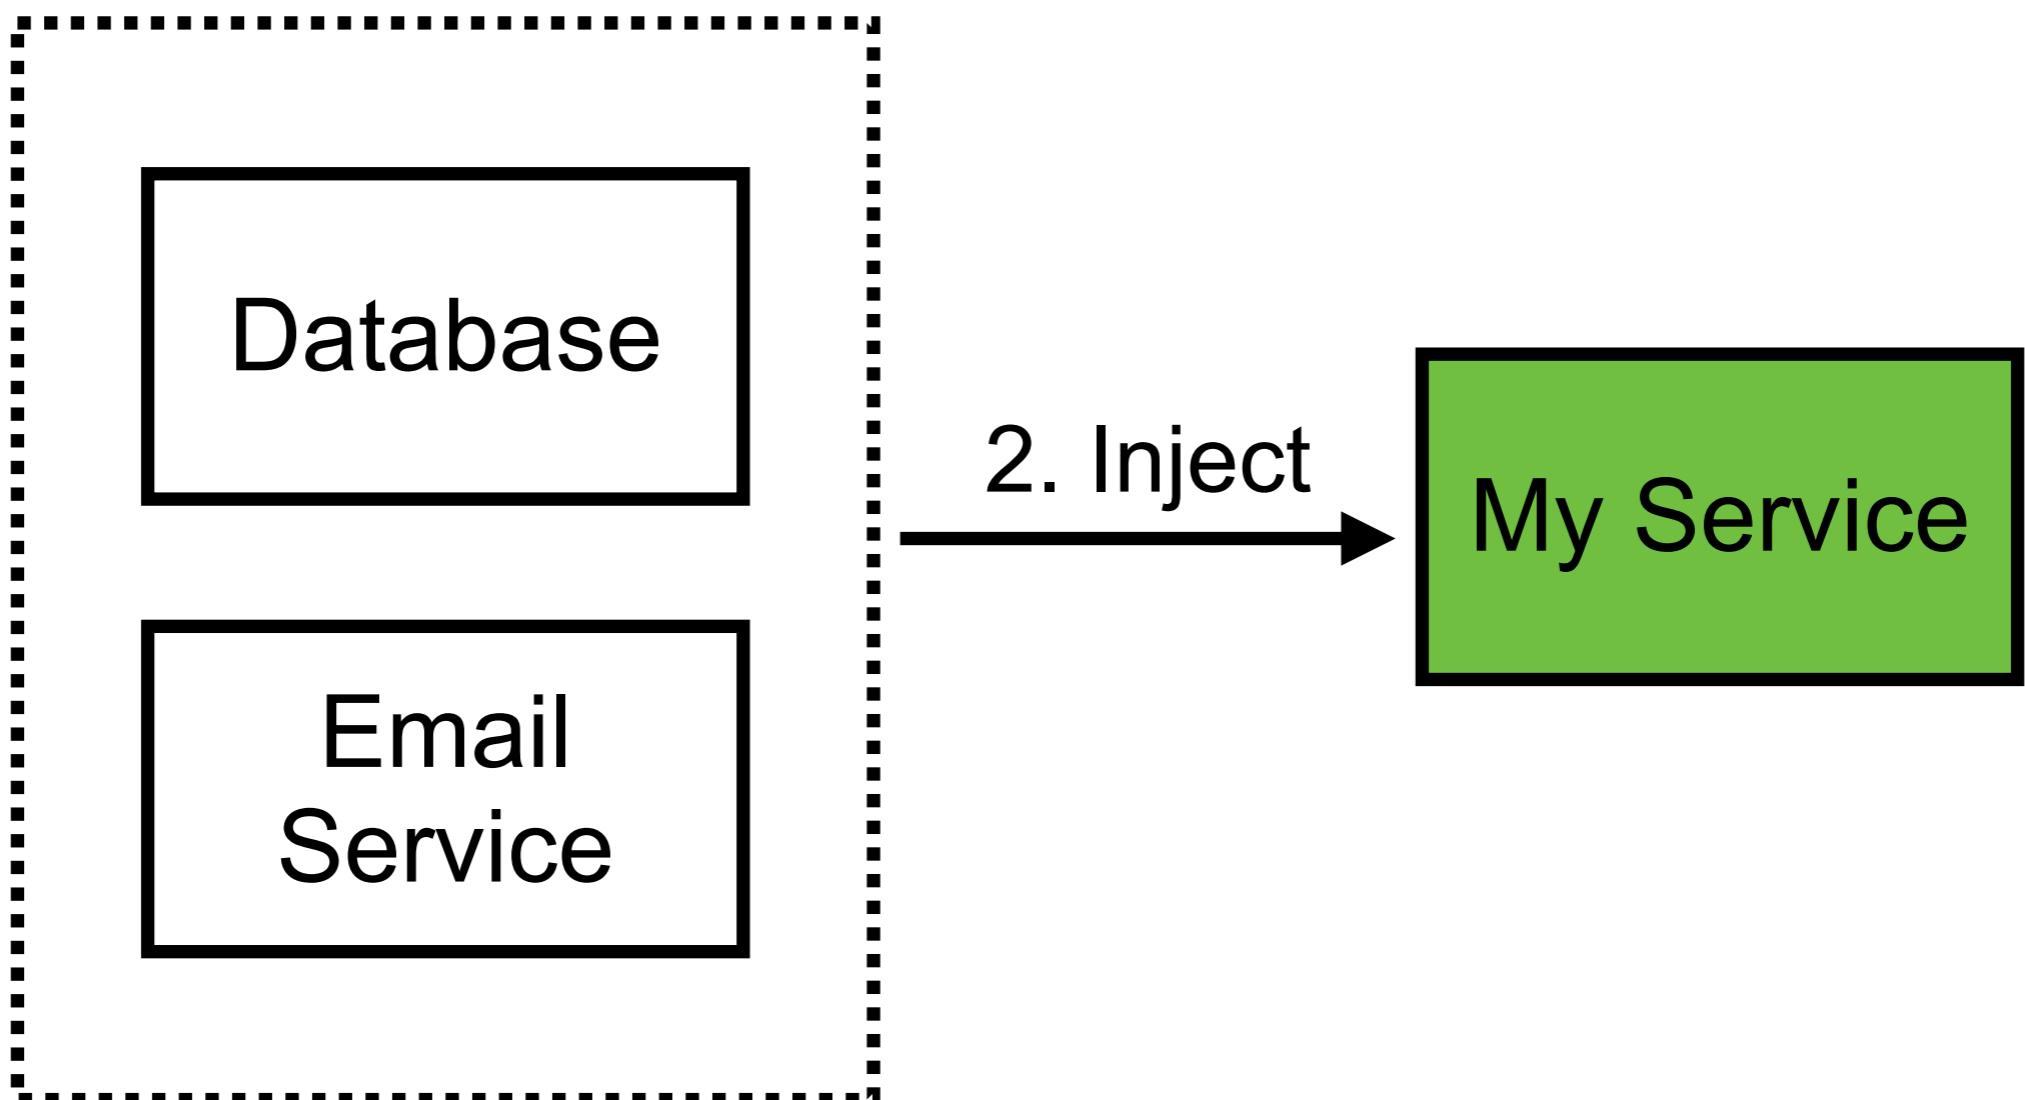

# **How to create database and email service ?**

# Use dependency injection

1. Create object of dependencies

# Use dependency injection

```
type MyService struct {
    Db    *Database
    Email *EmailService
}

func (s *MyService) Process() error {
    // 1. Create database connection
    s.Db.connect()
    // 2. Insert data into database
    s.Db.insertData()
    // 3. Create email service
    s.Email.connect()
    // 4. Send email
    s.Email.send()
}
```

# Create MyService with dependencies

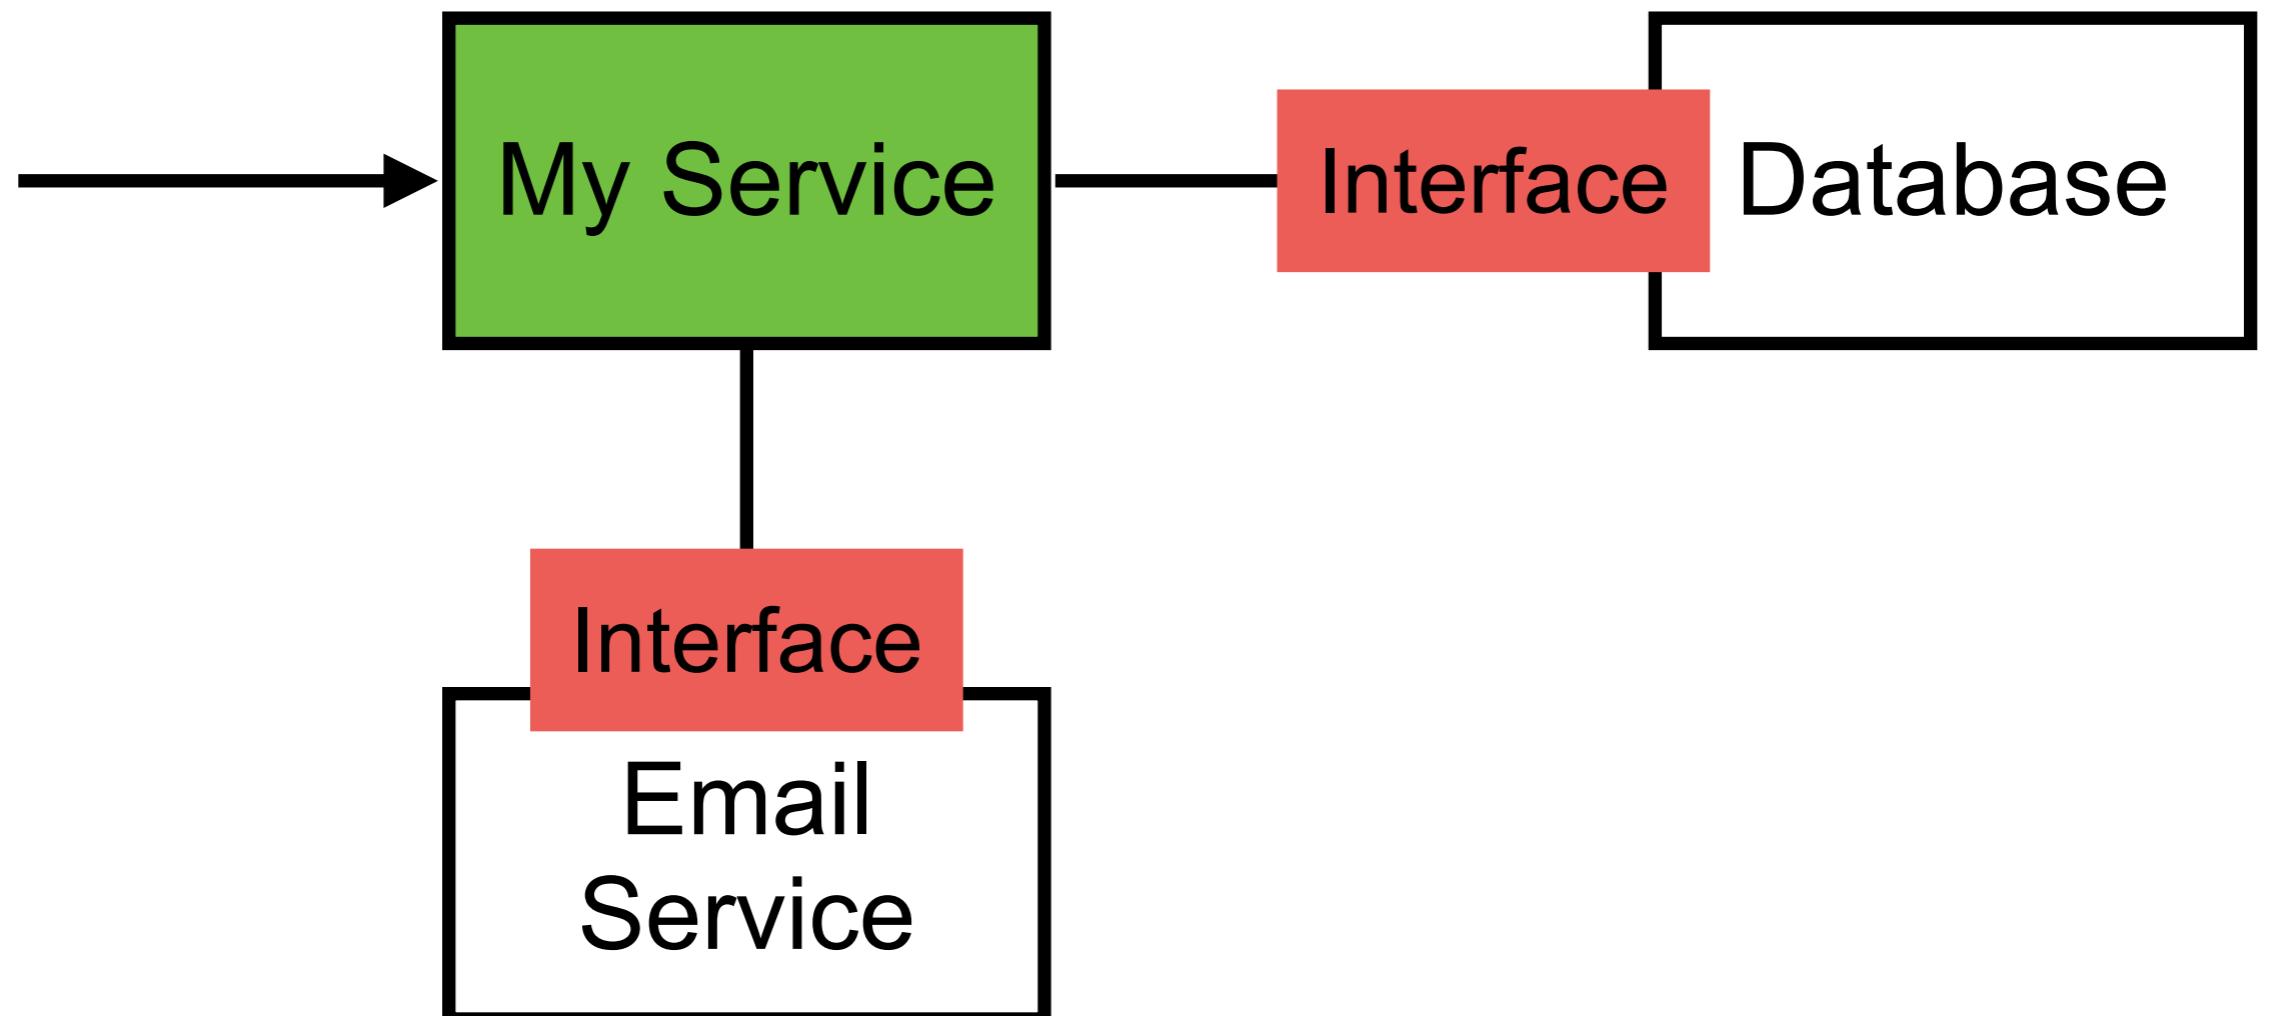

```
func NewMyService(db *Database, email *EmailService) *MyService
{
    return &MyService{
        Db:    db,
        Email: email,
    }
}
```

**How to test ?  
Easy to test ?  
Testable code ?**

# Working with interface ?

# Working with interface ?

```
type IDatabase interface {  
    connect() error  
    insertData() error  
}  
  
type IEmailService interface {  
    connect() error  
    send() error  
}
```

```
type MyService struct {  
    Db    IDatabase  
    Email IEmailService  
}  
  
func NewMyService(db IDatabase, email IEmailService) *MyService {  
    return &MyService{  
        Db:    db,  
        Email: email,  
    }  
}
```

# Try to test with Unit test

```
type MockDatabase struct{}

func (d *MockDatabase) connect() error {
    return nil
}

func (d *MockDatabase) insertData() error {
    return nil
}

type MockEmailService struct{}

func (e *MockEmailService) connect() error {
    return nil
}

func (e *MockEmailService) send() error {
    return nil
}
```

# Try to test with Unit test

```
func TestDI(t *testing.T) {  
  
    db := &MockDatabase{}  
    email := &MockEmailService{}  
    service := NewMyService(db, email)  
    service.Process()  
  
}
```

```
$go test -v
```

# Common mistakes with Interface

Create too many interfaces (pollution)

Don't design with interfaces, discover them

Create too many methods

Don't write behavior-driven interface

Create interface on the producer side

Create interface for testing

# Go Proverbs

Simple, Poetic, Pithy

Don't communicate by sharing memory, share memory by communicating.

Concurrency is not parallelism.

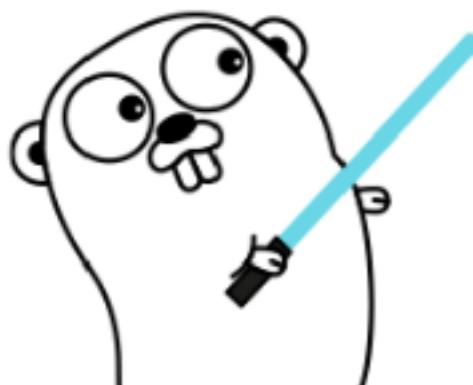

Channels orchestrate; mutexes serialize.

The bigger the interface, the weaker the abstraction.

Make the zero value useful.

interface{} says nothing.

Gofmt's style is no one's favorite, yet gofmt is everyone's favorite.

A little copying is better than a little dependency.

Syscall must always be guarded with build tags.

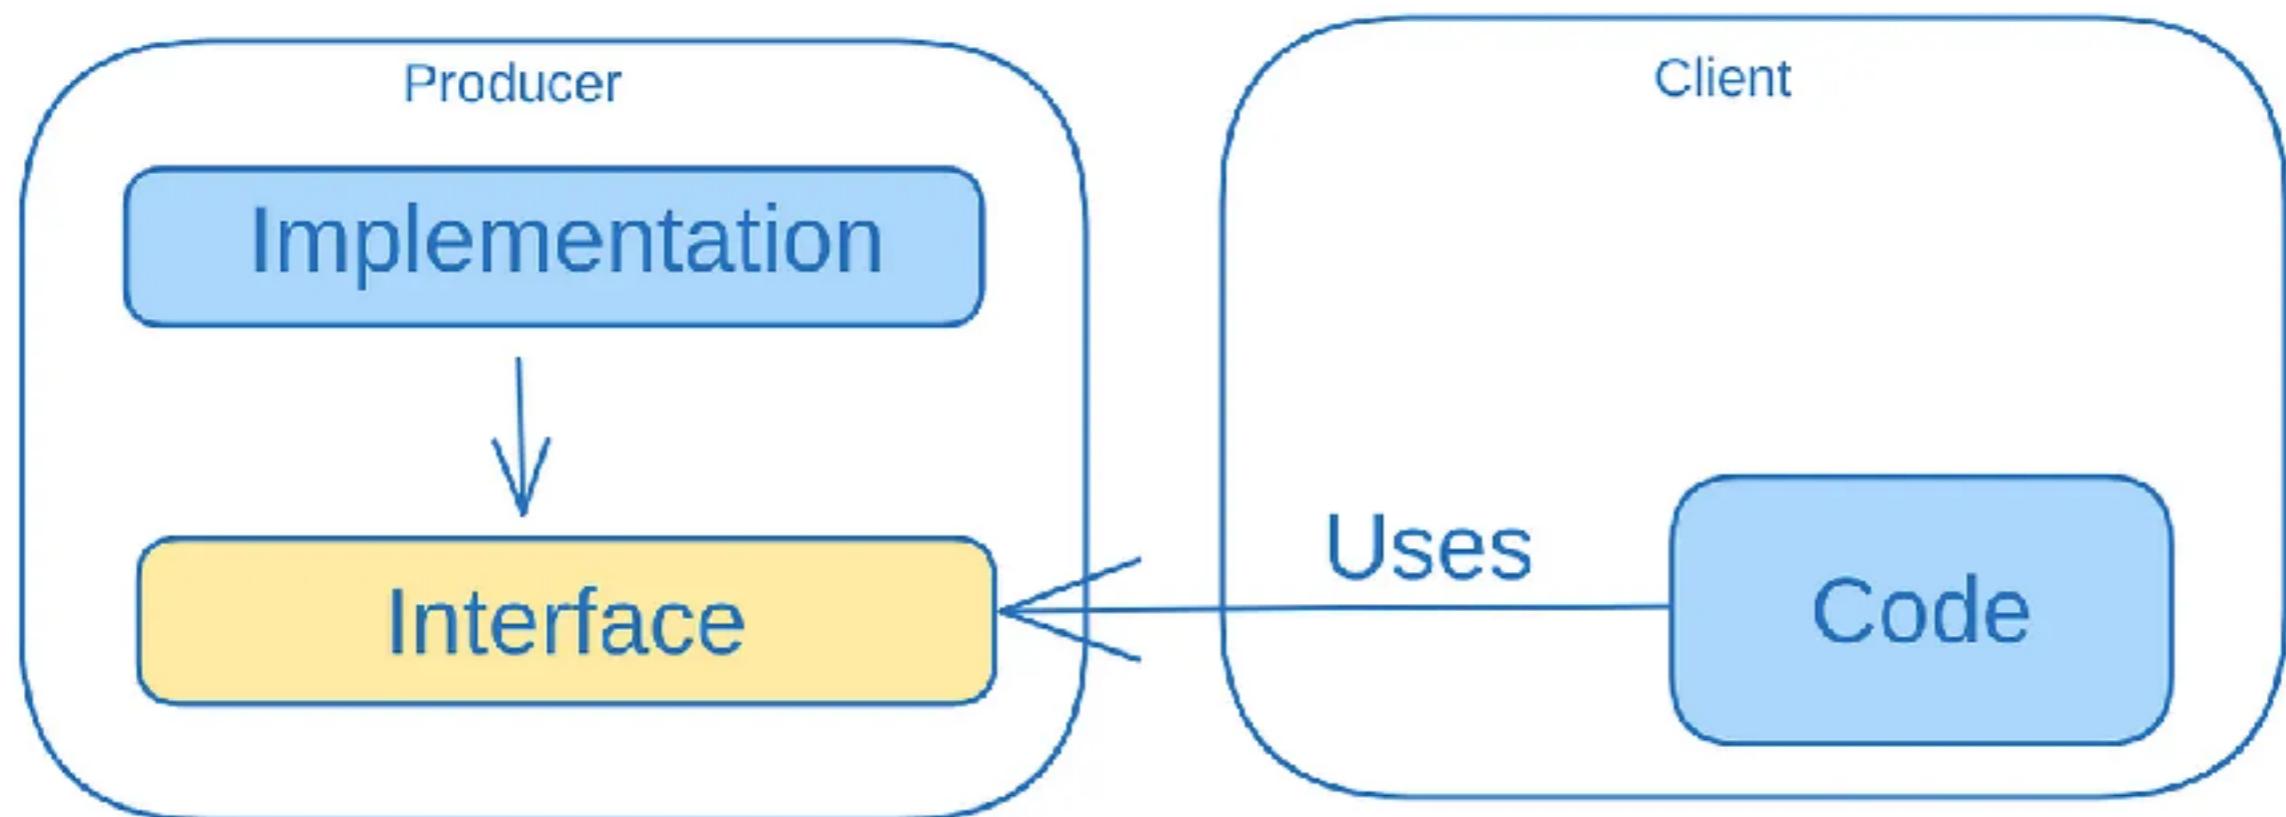

Cgo must always be guarded with build tags.

Cgo is not Go.

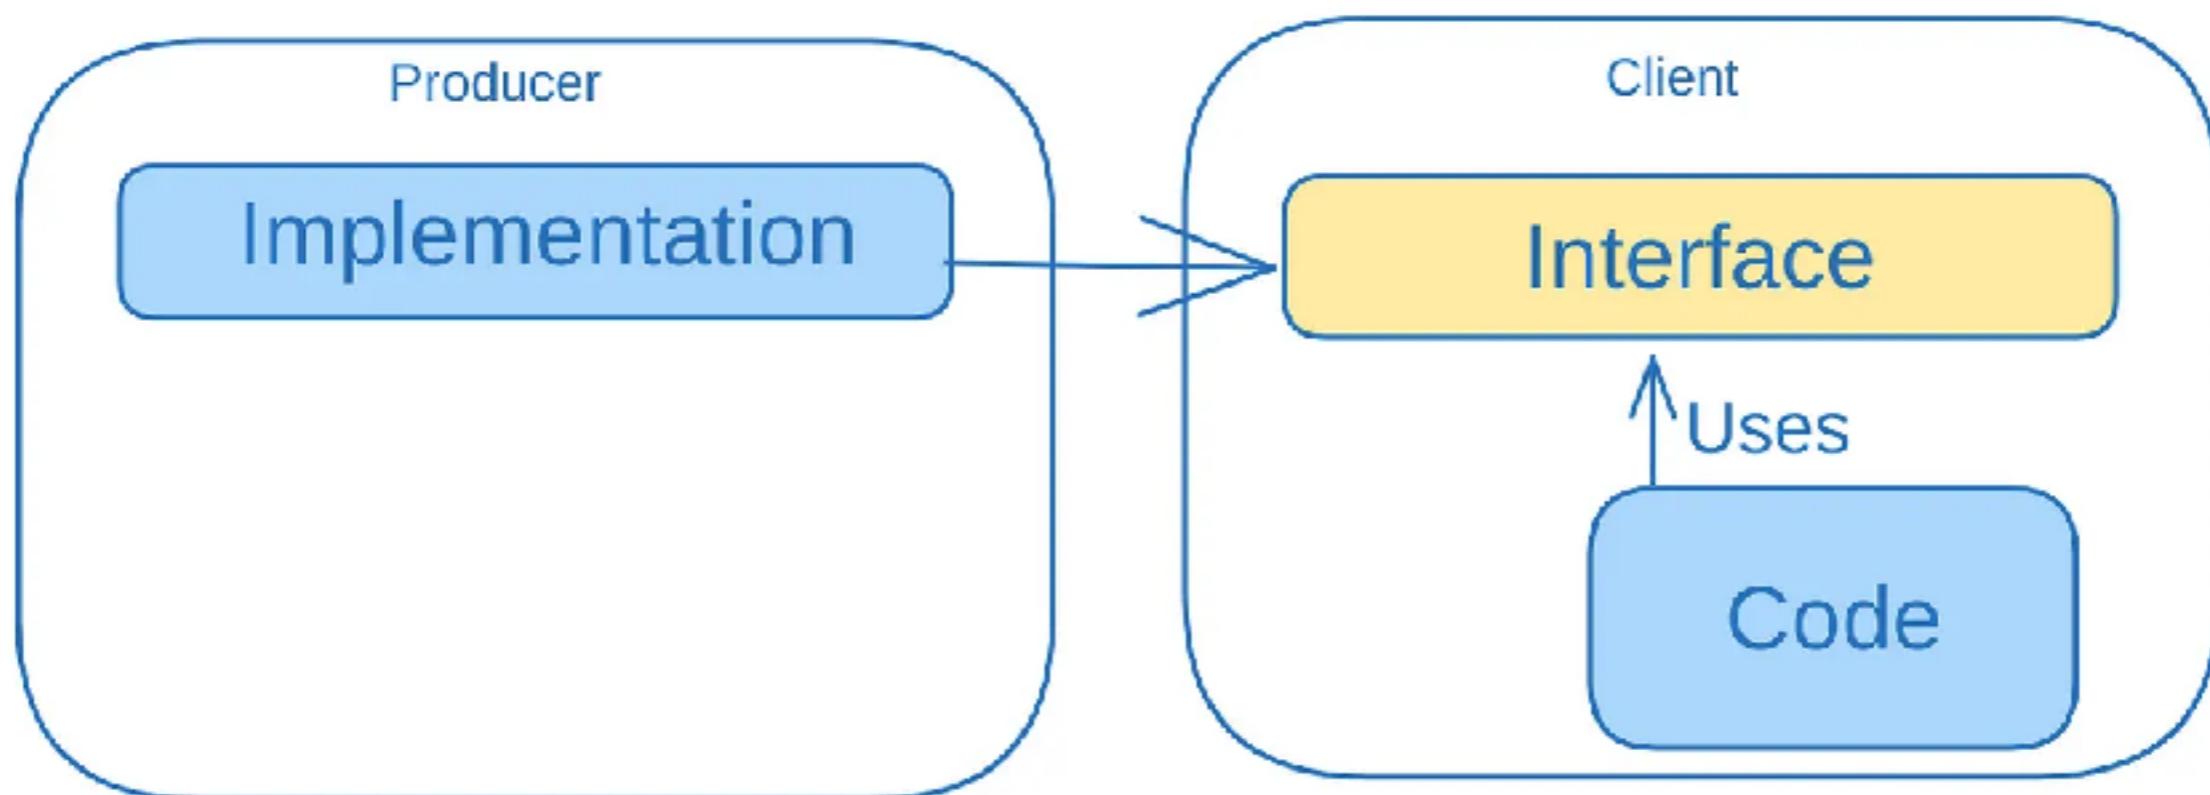

<https://dave.cheney.net/2016/04/27/dont-just-check-errors-handle-them-gracefully>

# Create interface on producer side

# Create interface on consumer side

# Better interface !!

```
type UsersRepository interface {  
    GetAllUsers()  
    GetUser(id string)  
}  
  
type UserRepository struct {  
}  
  
func (UserRepository) GetAllUsers() {}  
func (UserRepository) GetUser(id string) {}
```

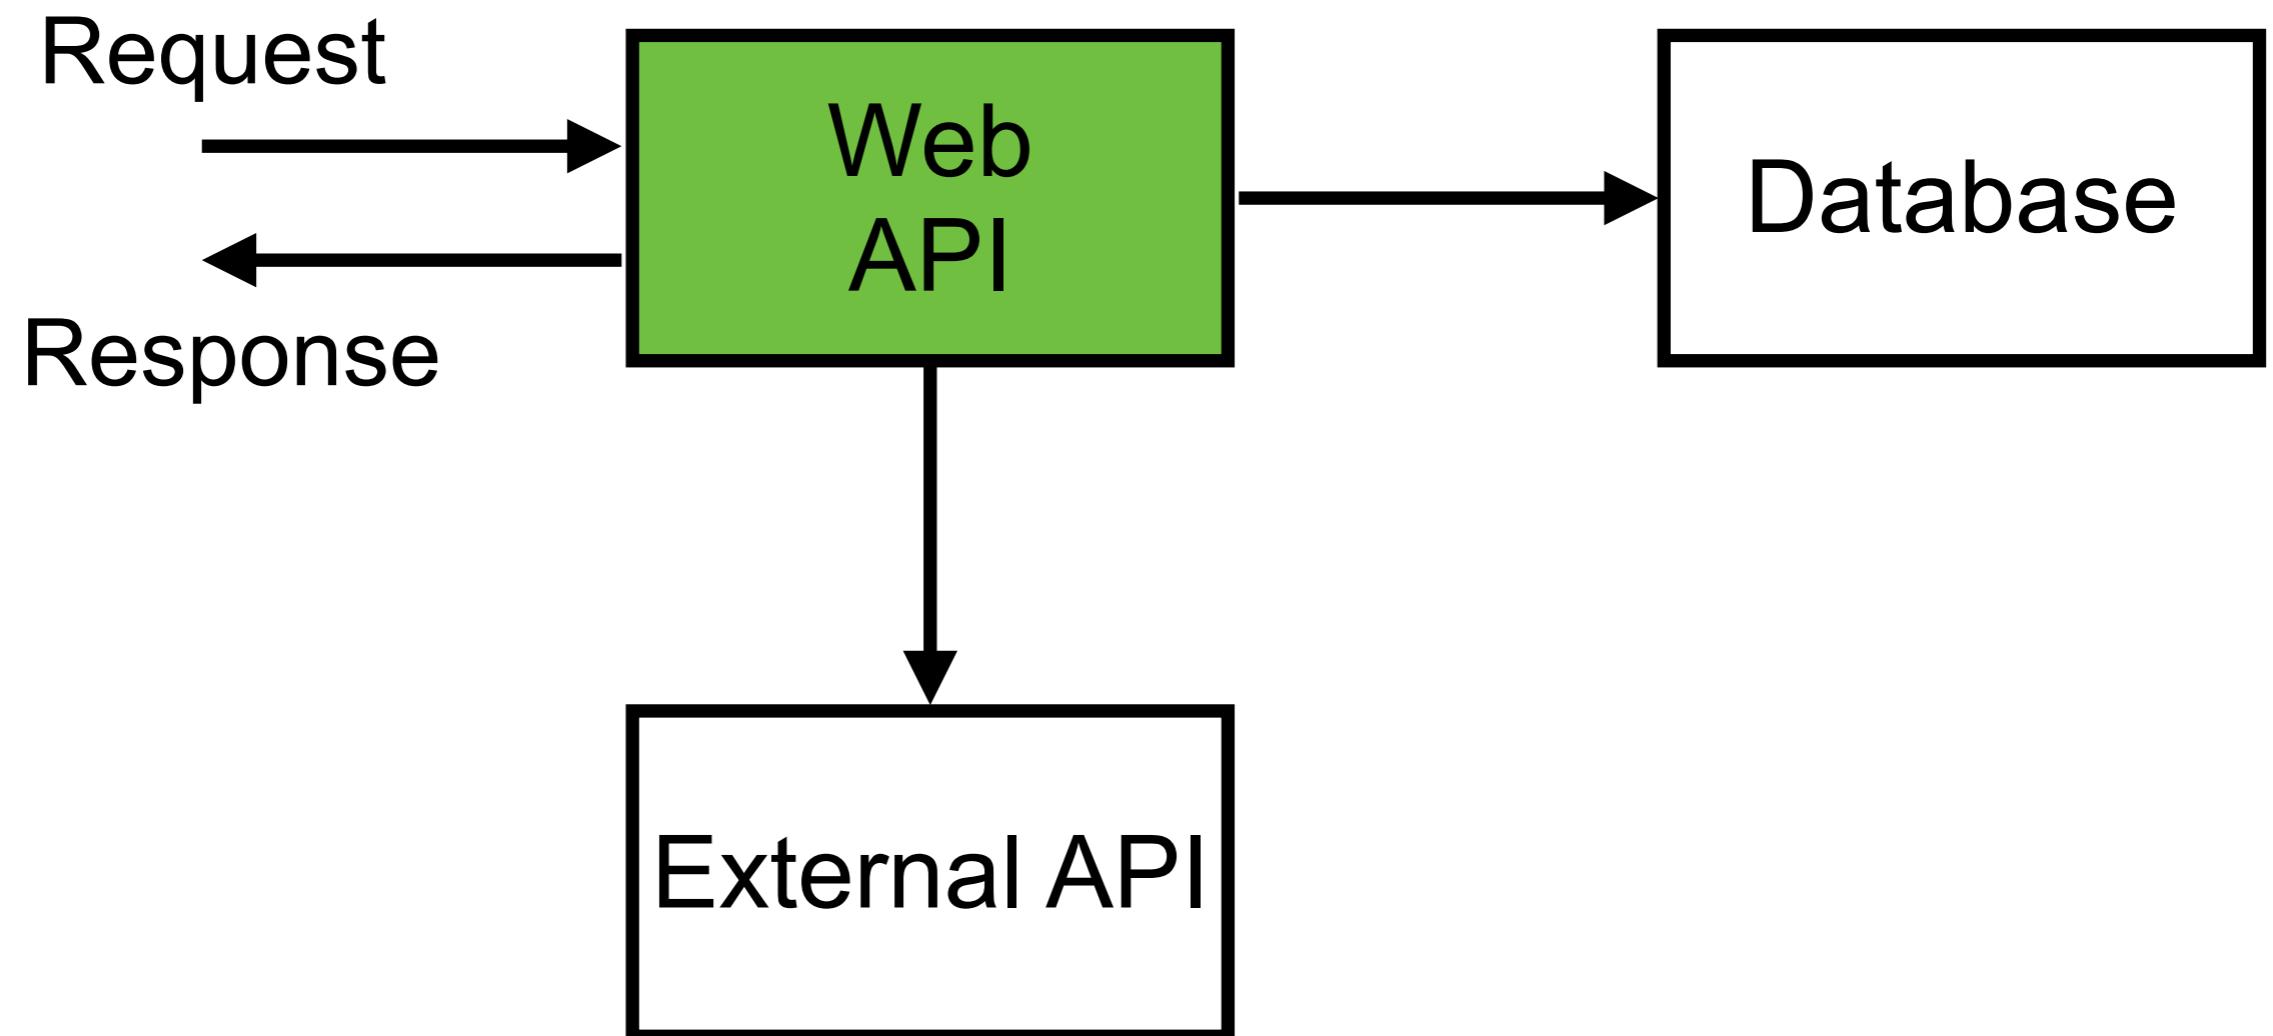

```
type UserGetter interface {  
    GetUser(id string)  
}
```

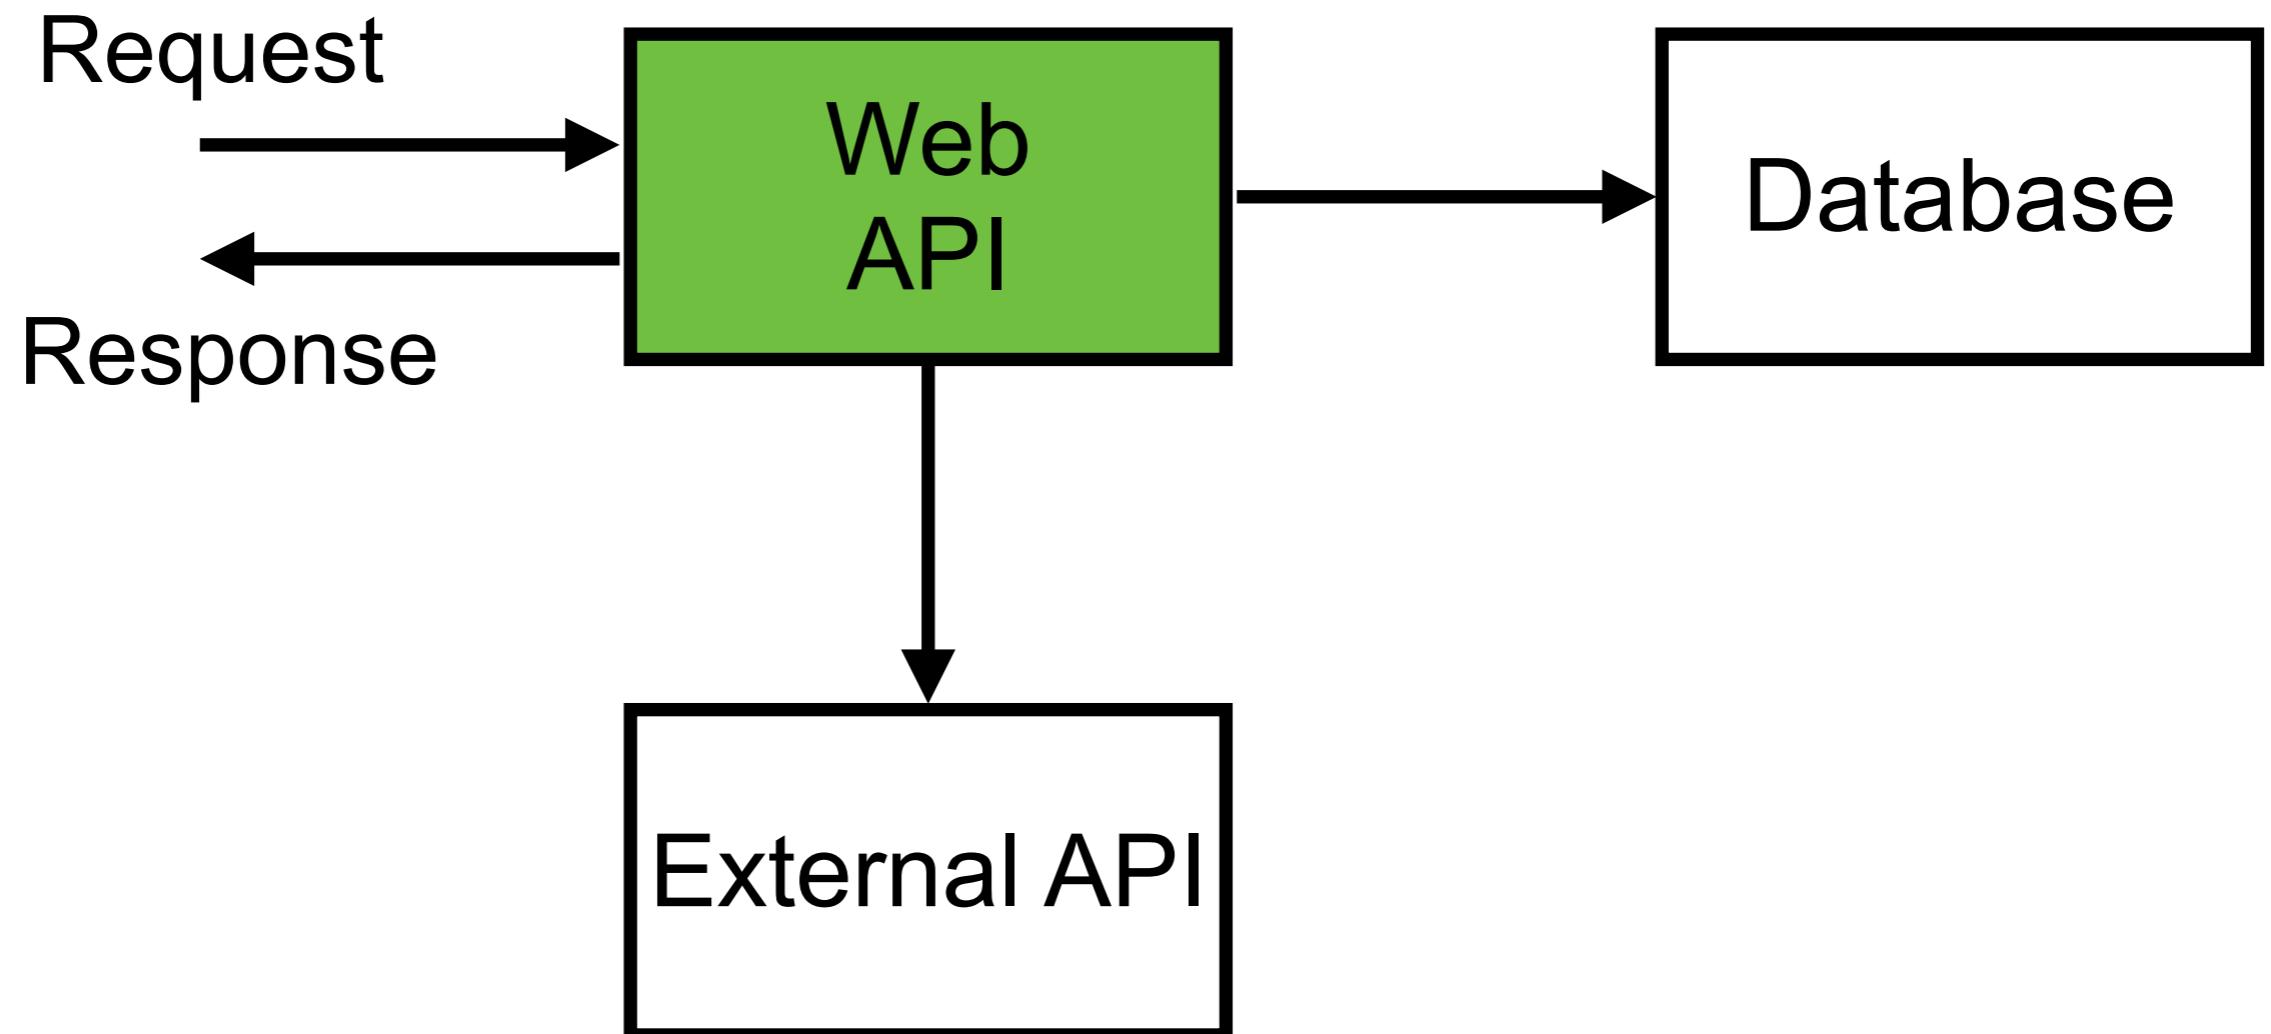

# Test Strategies

# Architecture

# What to Test ?

# **Component and Contract Testing**

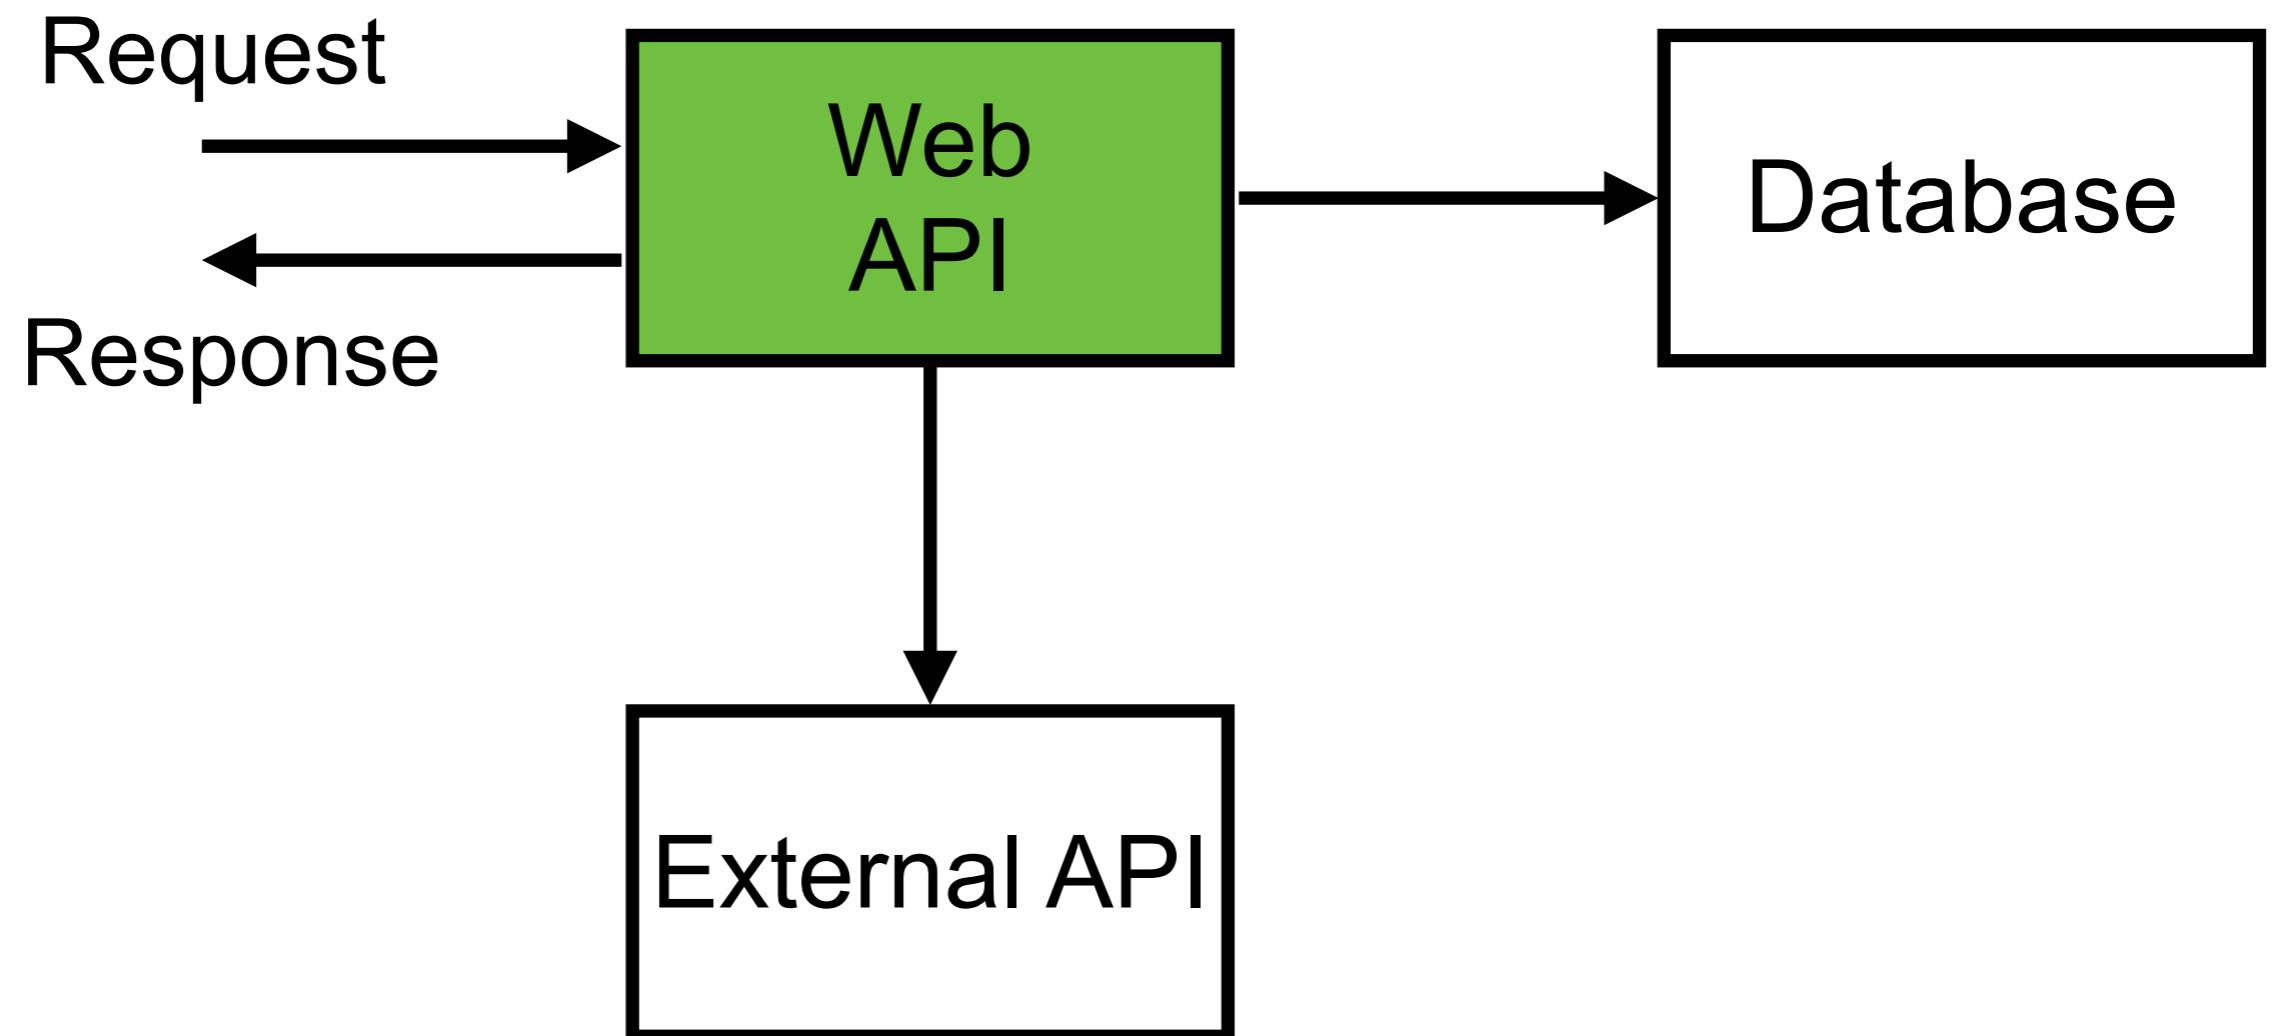

<https://github.com/up1/course-contract-testing>

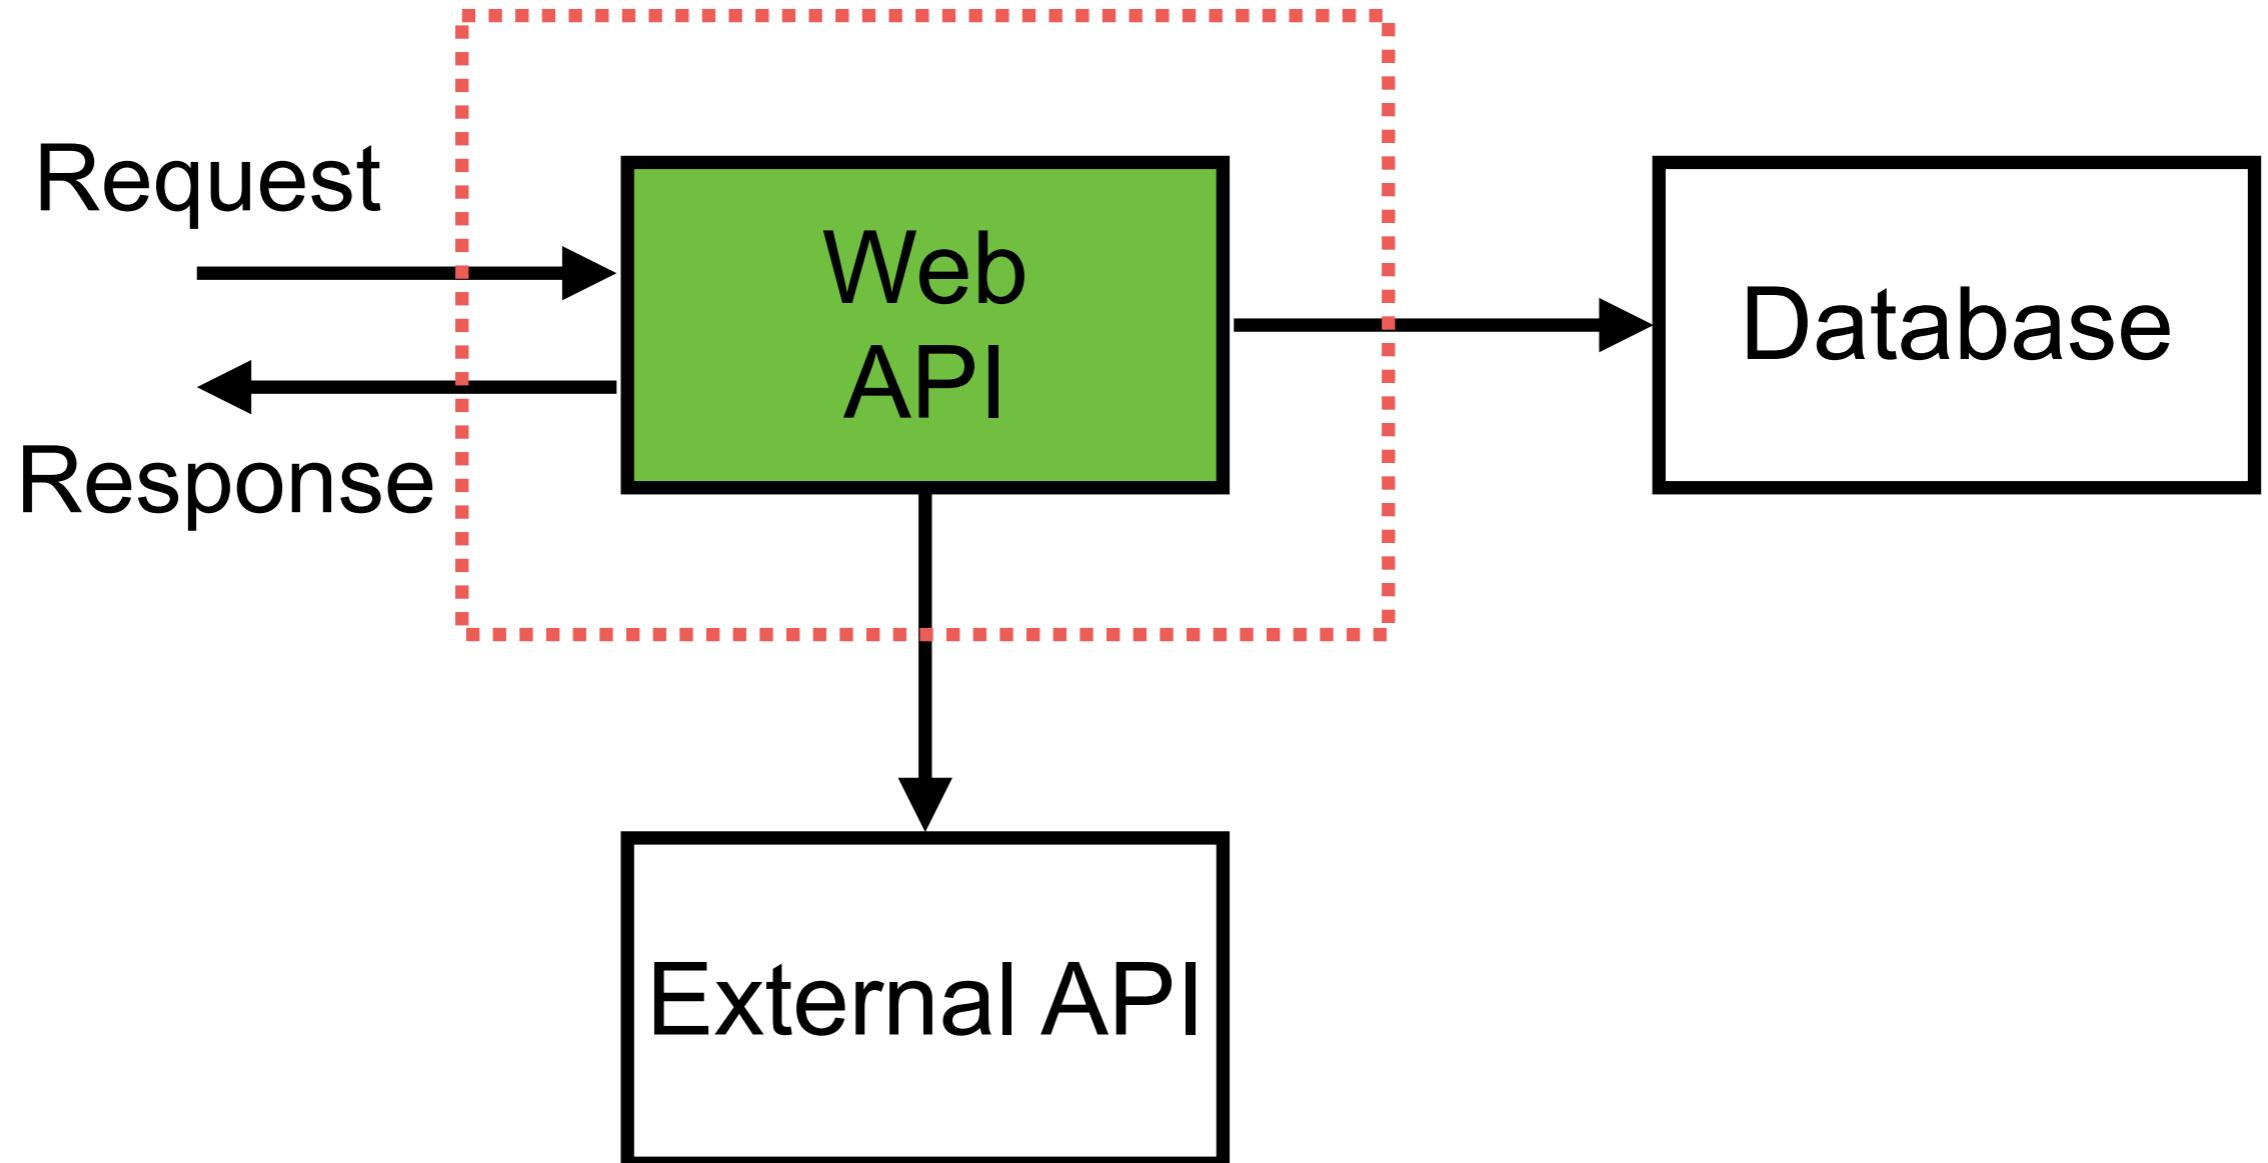

# Component Testing

# Component Testing

# Component Testing

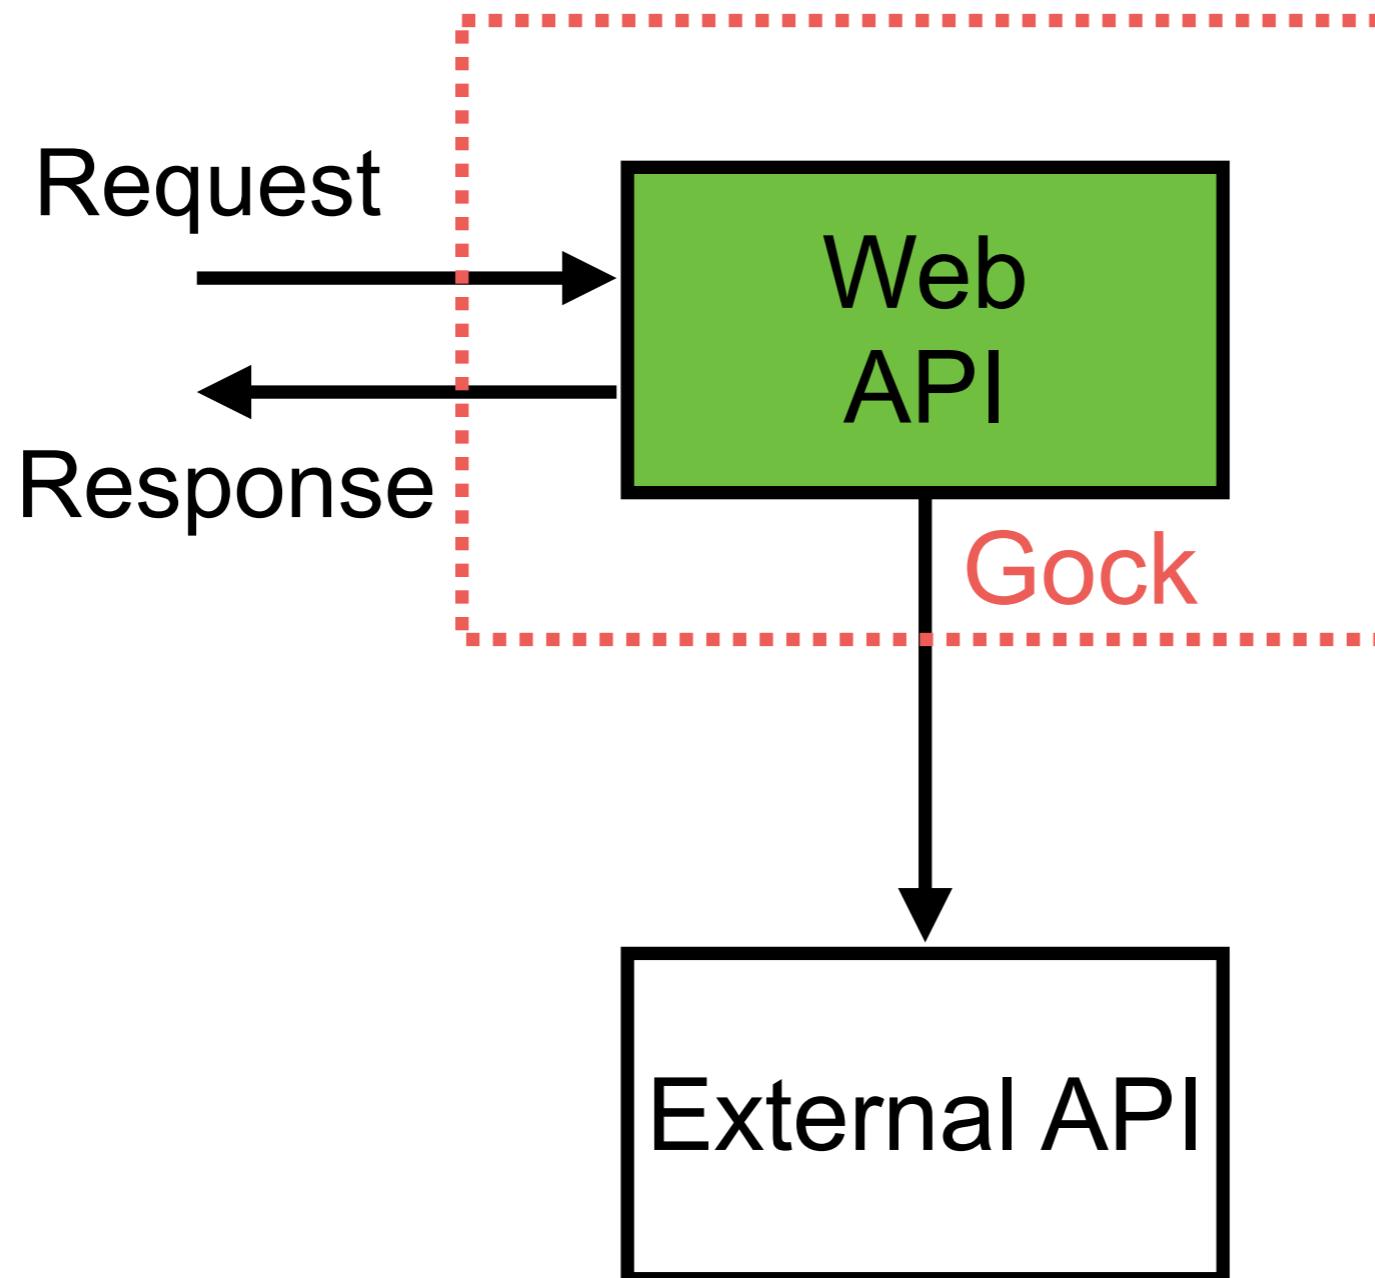

# Component testing

In-process  
Separate process

# In-process with Gock

<https://github.com/h2non/gocek>

# Try to test with Gock

```
func TestSimple(t *testing.T) {
    defer gock.Off()

    // Arrange
    gock.New("http://facebook.com").
        Get("/bar").
        Reply(200).
        JSON(map[string]string{"foo": "bar"})

    // Act
    res, err := http.Get("http://facebook.com/bar")

    // Assert
    st.Expect(t, err, nil)
    st.Expect(t, res.StatusCode, 200)

    body, _ := ioutil.ReadAll(res.Body)
    st.Expect(t, string(body)[:13], `{"foo":"bar"}`)

    // Verify that we don't have pending mocks
    st.Expect(t, gock.IsDone(), true)
}
```

```
$go test -v
```

# Project Structure

# Good structure ?

Consistent

Easy to understand, navigate and reason

Easy to change, loosely coupled

**Easy to test**

Simple as possible

Structure reflects the design !!

# Project Structure

Flat structure

Layer (group of function)

Group by module

Group by context

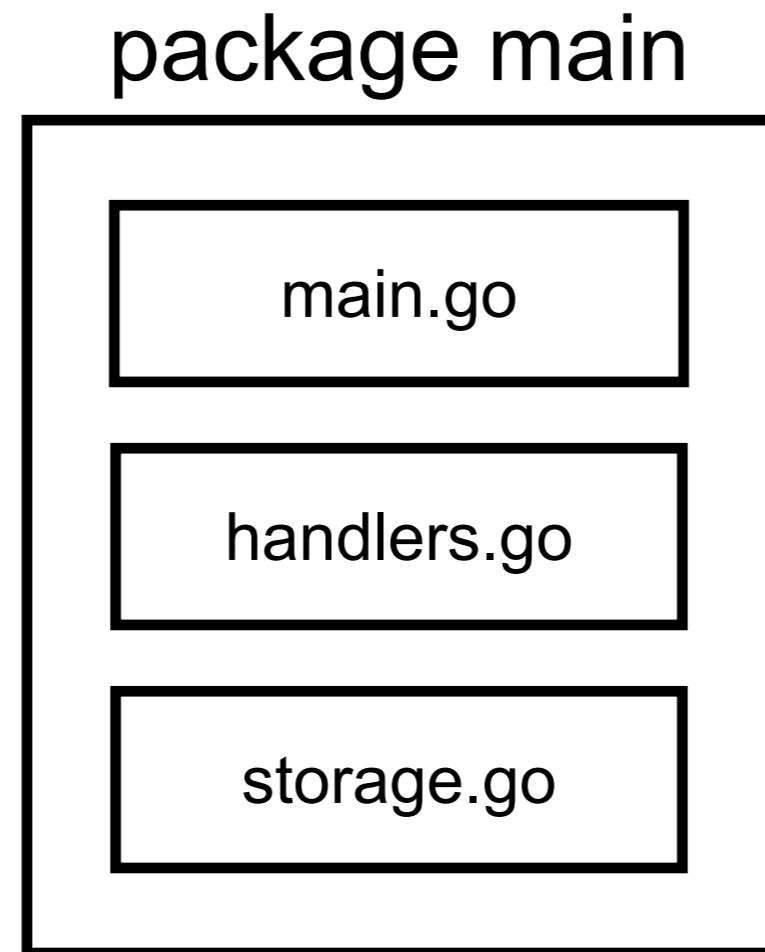

Clean architecture

Hexagonal architecture

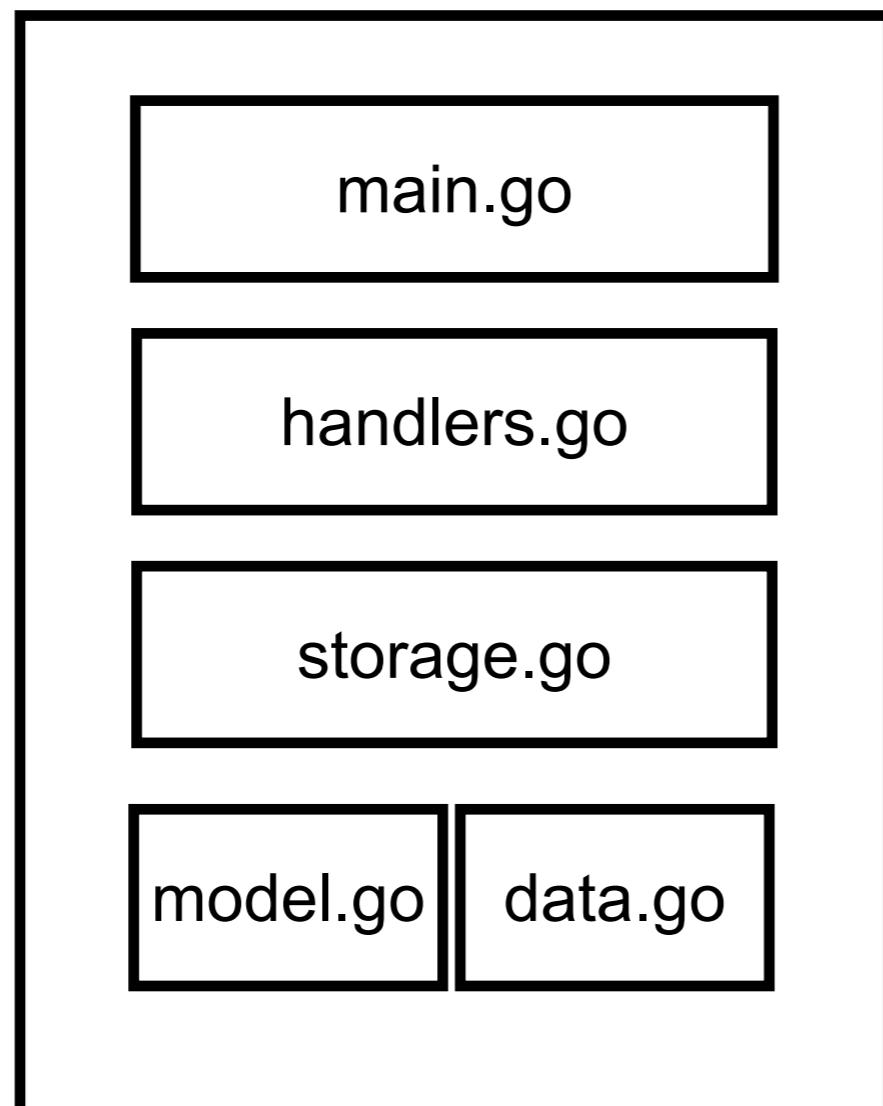

# Flat structure

Easy to start  
Only main package

# Beer !!

package main

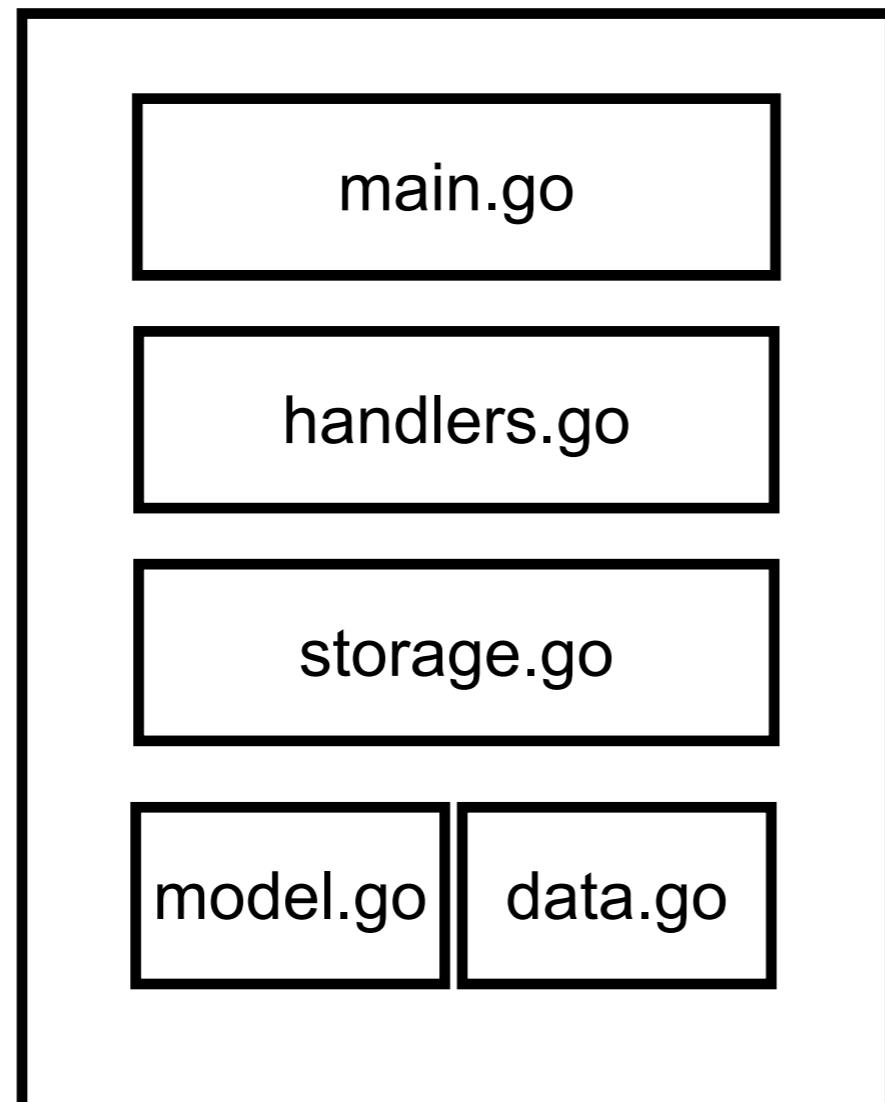

Create Storage as global variable  
Start Web server

# Beer !!

package main

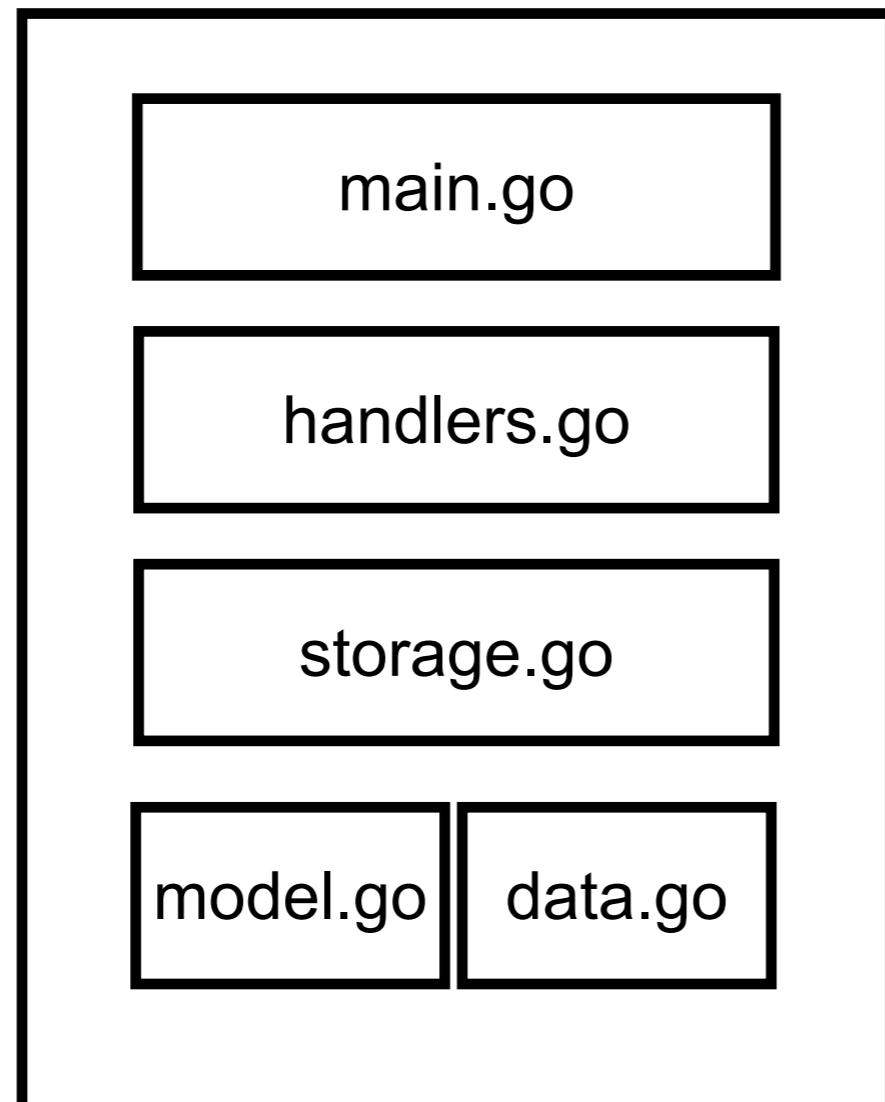

Create Storage as global variable  
Start Web server

GET /beers  
POST /beers

# Beer !!

package main

Create Storage as global variable

Start Web server

GET /beers

POST /beers

GetBeers() from memory

SaveBeer(beer) into memory

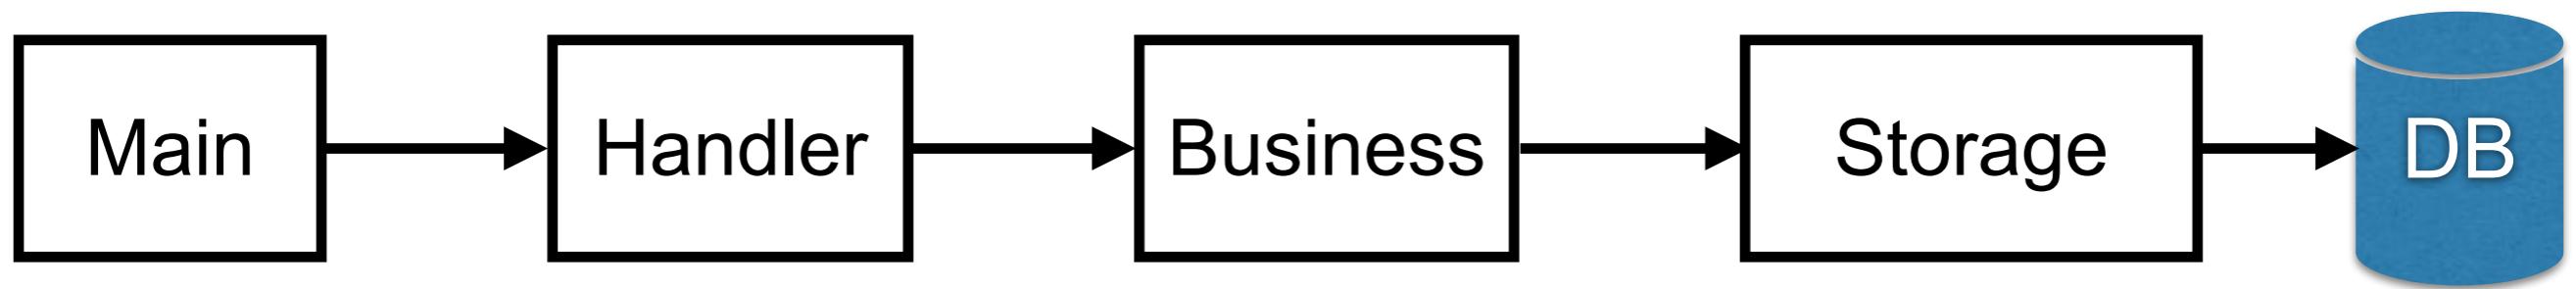

# How to test ?

Storage  
Handler (integration)  
Handler (mock)

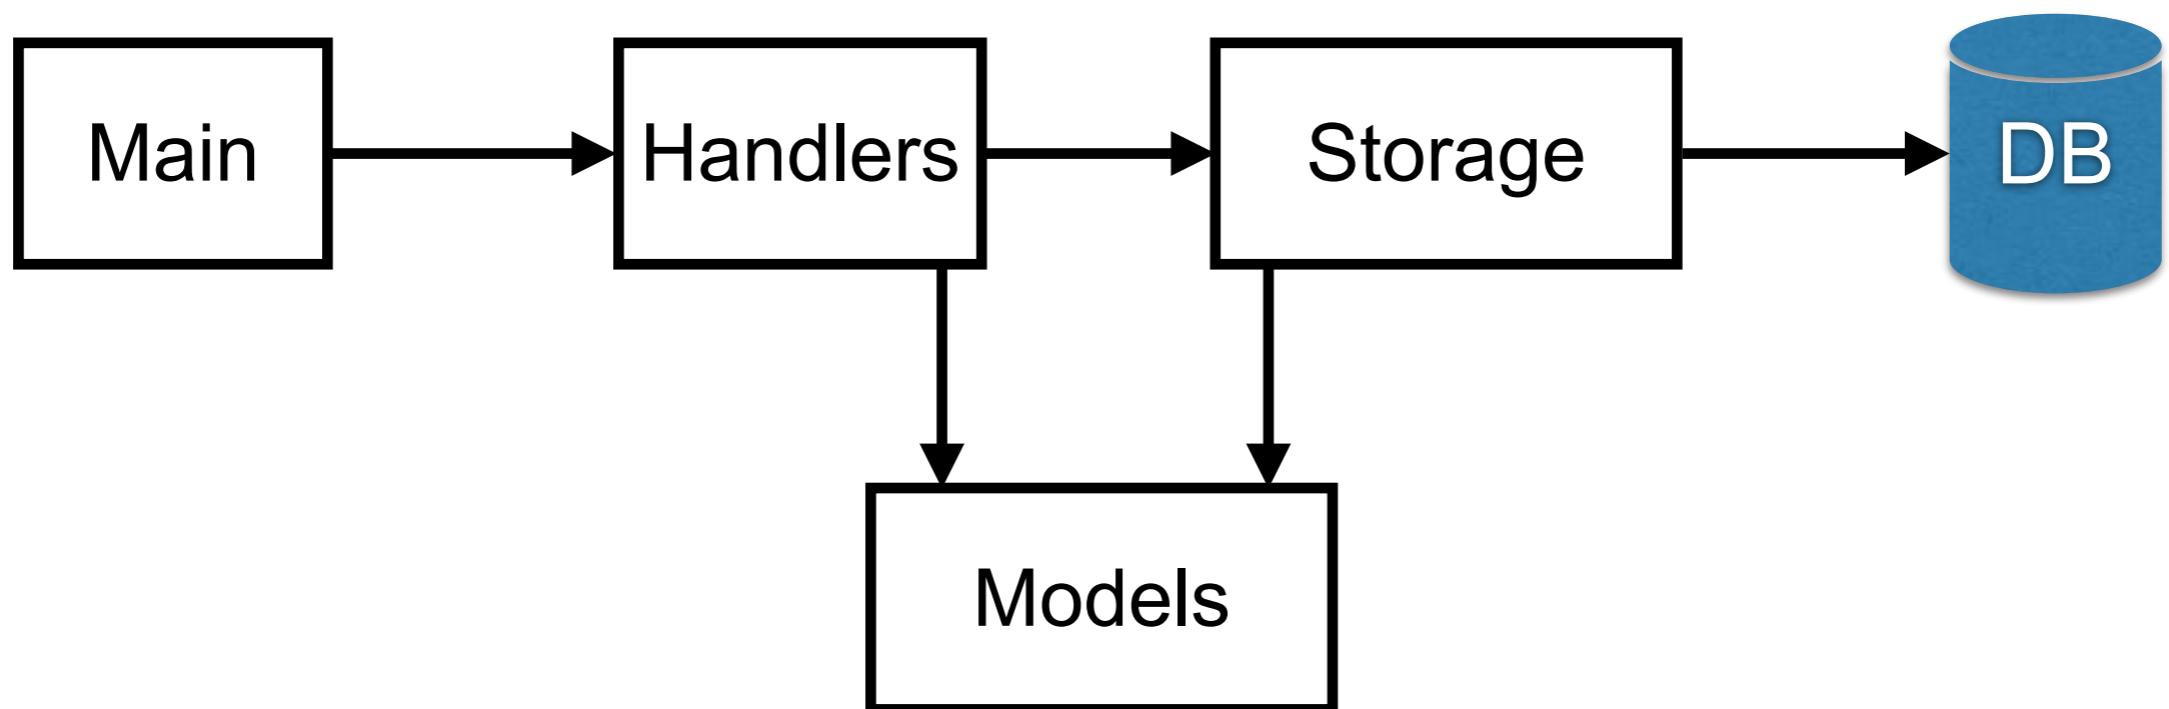

# Layer

Grouping by function

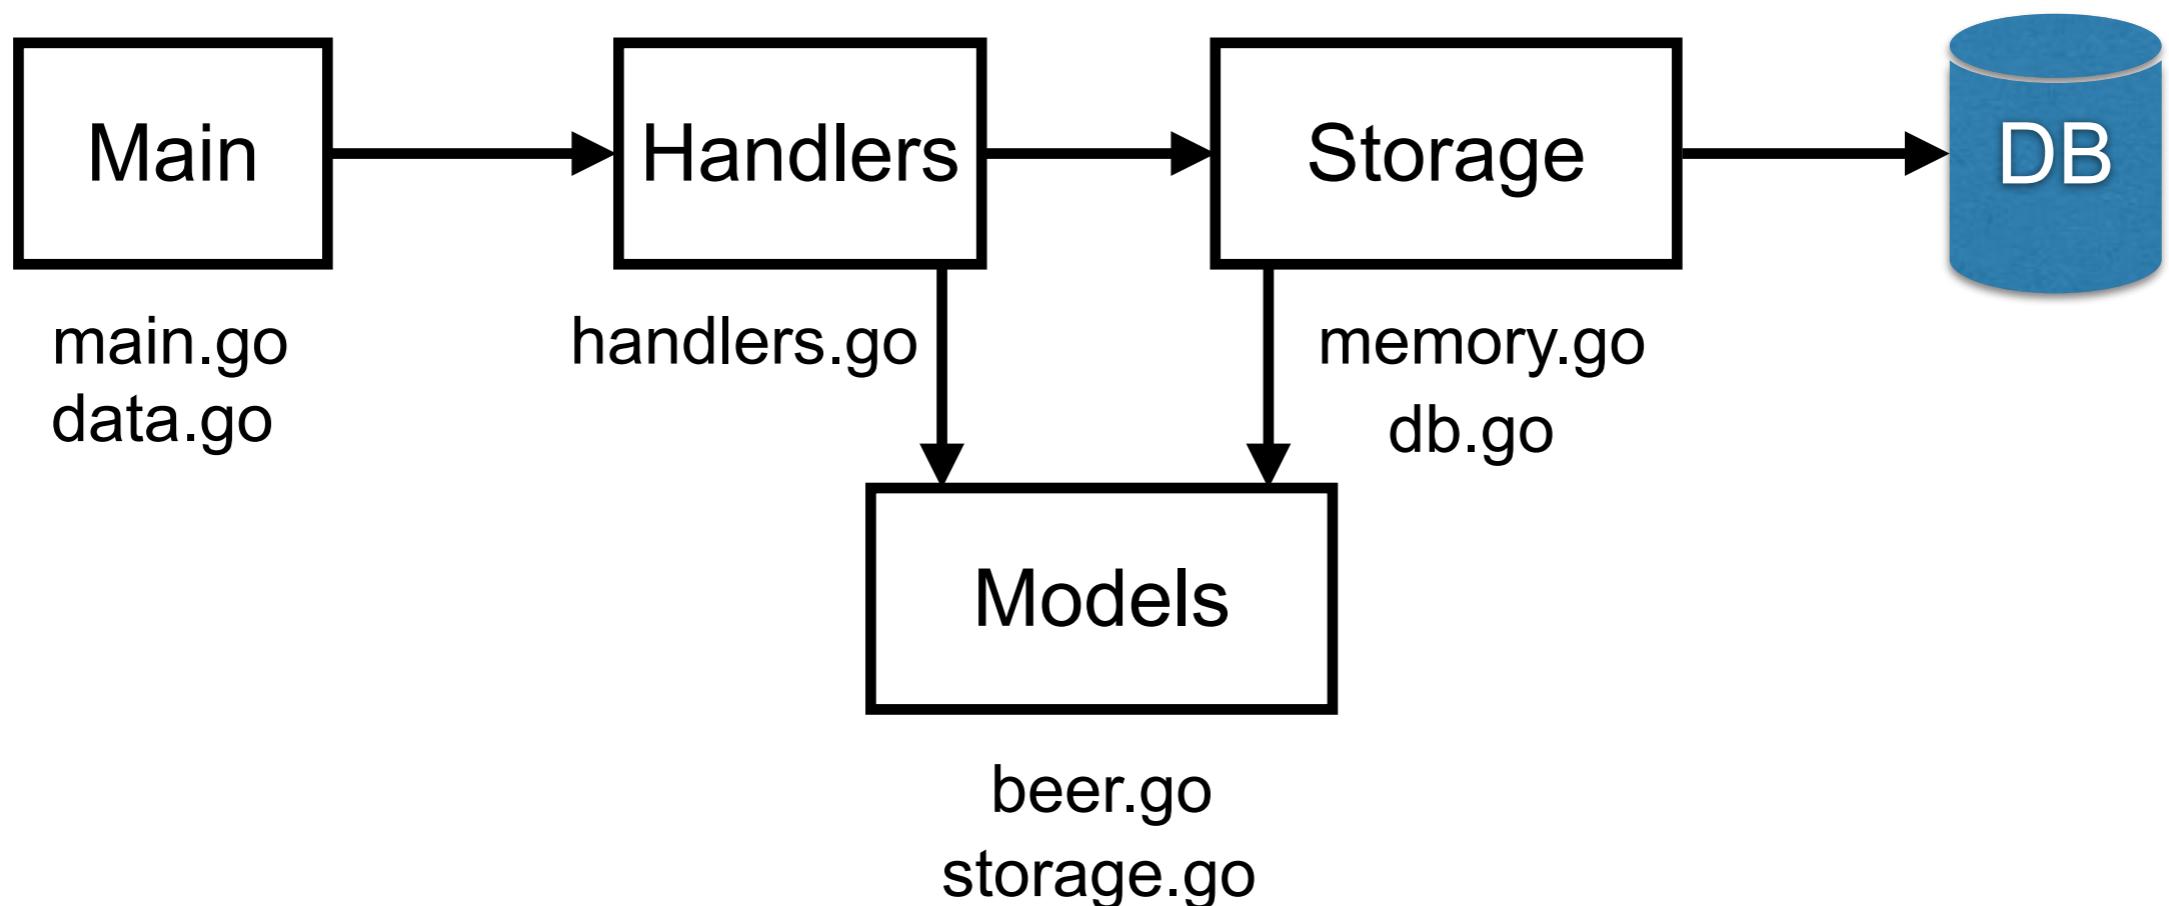

# Layer

Grouping by function

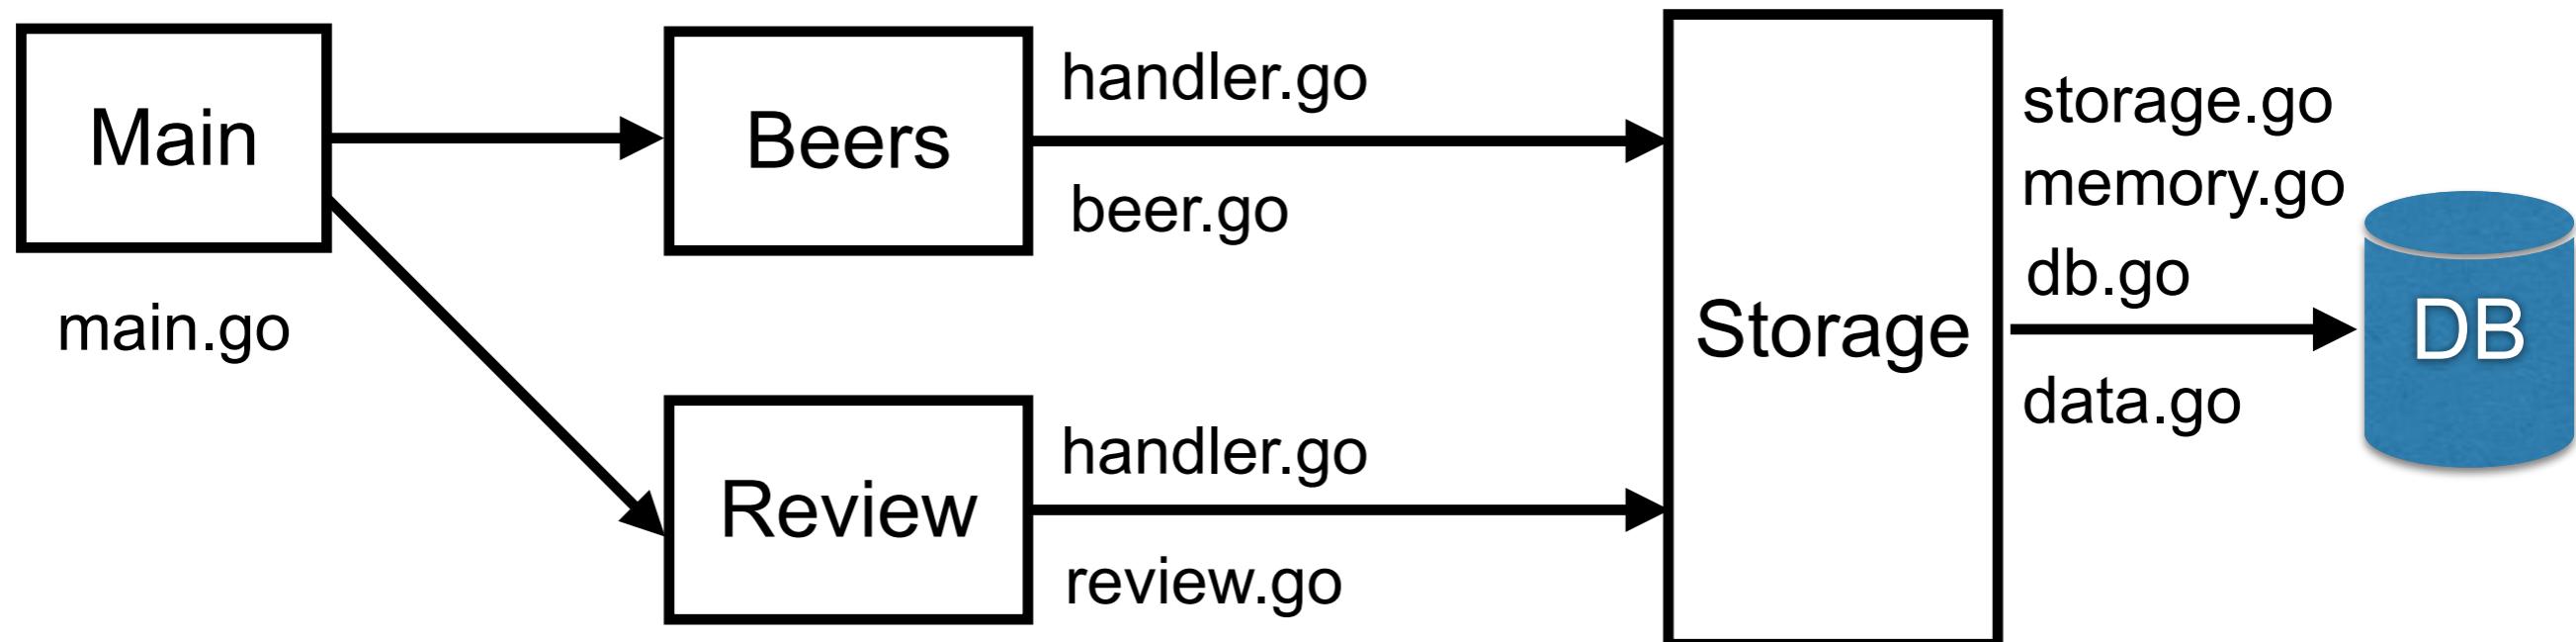

# Layer

## Grouping by function

# Modular

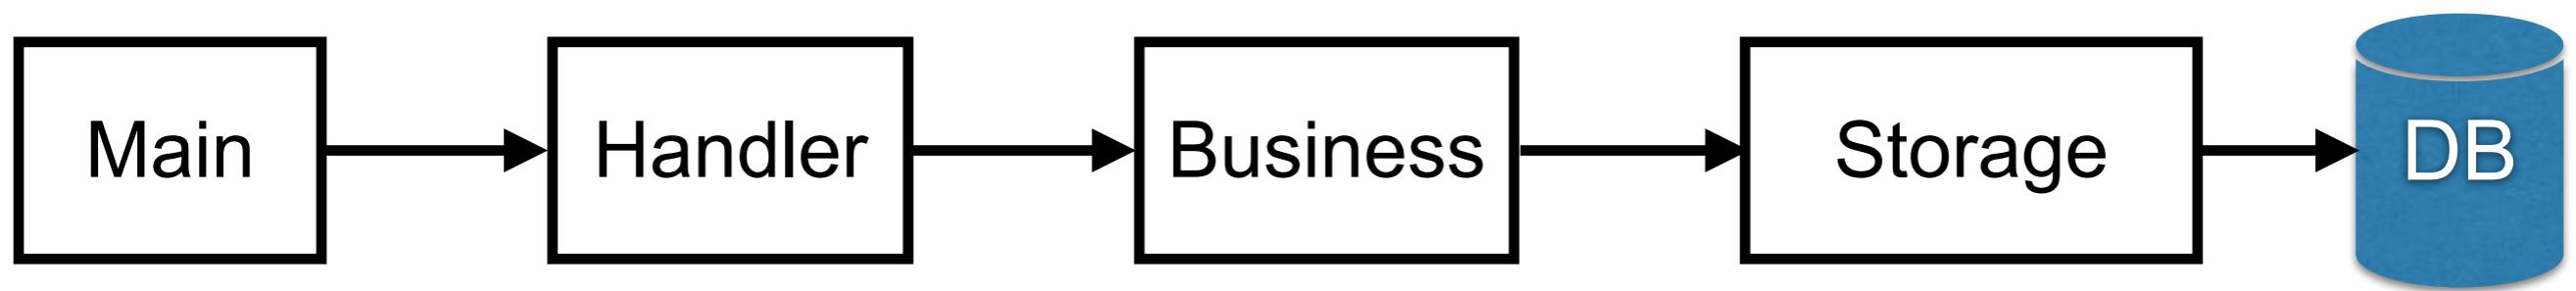

## Grouping by module

# Manage Dependency

# Manage Dependency ?

# Manage Dependency ?

## Global variable

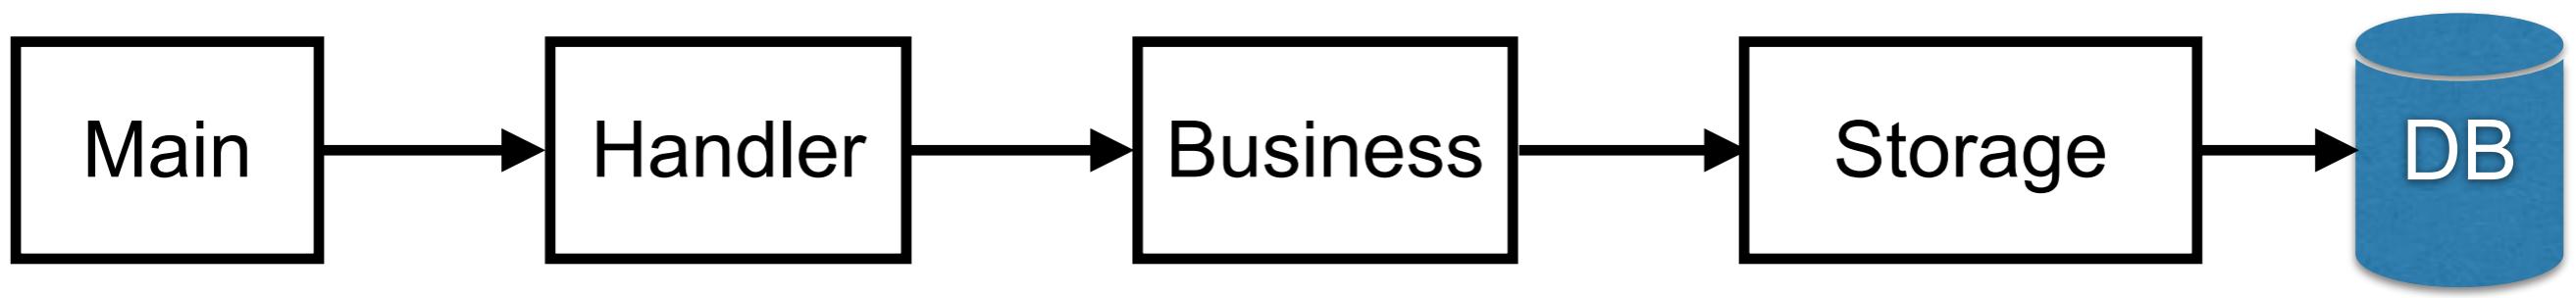

```
// Global variable
var db Storage

func setupRouter() *gin.Engine {
    var err error
    db, err = NewStorage()
    if err != nil {
        log.Fatal(err)
    }
}
```

# Manage Dependency ?

Dependency with Struct

```

type MyConfig struct {
    Db Storage
}

func setupRouter() *gin.Engine {
    db, _ := NewStorage()
    config := &MyConfig{Db: db}

    PopulateBeers(config)

    r := gin.New()
    r.GET("/beers", config.GetBeers)
    r.POST("/beers", config.AddBeer)
    return r
}

```

## 1. Create and initial

```

func (config *MyConfig) GetBeers(c *gin.Context) {
    beers, err := config.Db.FindBeers()
    if err != nil {
        c.AbortWithStatus(http.StatusBadRequest)
        return
    }
    c.JSON(http.StatusOK, beers)
}

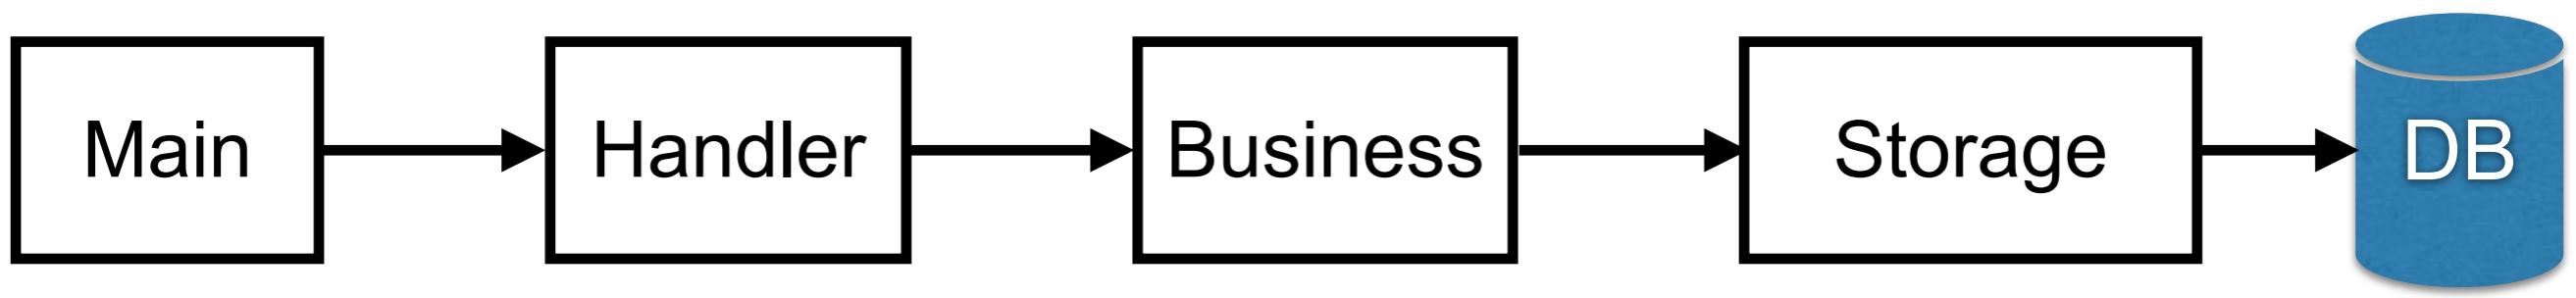

```

## 2. Add receiver

# Manage Dependency ?

Dependency with closure

```
type MyConfig struct {
    Db Storage
}

func setupRouter() *gin.Engine {
    db, _ := NewStorage()
    config := &MyConfig{Db: db}

    PopulateBeers(config)

    r := gin.New()
    r.GET("/beers", GetBeers(config))
    r.POST("/beers", AddBeer(config))
    return r
}
```

## 1. Create and initial

```
func GetBeers(config *MyConfig) gin.HandlerFunc {
    return func(c *gin.Context) {
        beers, err := config.Db.FindBeers()
        if err != nil {
            c.AbortWithStatus(http.StatusBadRequest)
            return
        }
        c.JSON(http.StatusOK, beers)
    }
}
```

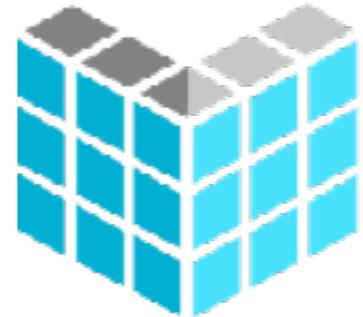

## 2. Use closure

# Graceful Shutdown

# Graceful Shutdown

How to make sure, existing requests are successfully responded before shutdown ?

# Signals

Signal	Action	
SIGTERM	Kill command	kill <process id>
SIGINT	CTRL + C	Terminate foreground process
SIGKILL SIGSTOP		Can't handle from code

# Structured Logging

<https://go.dev/blog/slog>

# Log Format ?

## Structured

- Usually JSON or LogFmt.
- Least human-readable.
- Easy to parse, search and filter.
- Consistent formatting.
- Faster troubleshooting due to added context.
- Automated reporting and analysis.

RECOMMENDED

## Semi-structured

- Mix of structured and unstructured data.
- Human-readable.
- Formatting variability leads to inconsistency.
- Limited automation possibilities.
- Requires a more complex parsing logic.

## Unstructured

- Free-form plain text messages.
- Human-readable.
- Challenging to parse.
- Requires manual interpretation.
- Suitable only for quick ad-hoc logging in development environments.

NOT RECOMMENDED

<https://betterstack.com/community/guides/logging/structured-logging/>
